P.C. 1059, dated the 16th day of April, 1917, empowering the Minister of Customs to fix the quantity and price of newsprint paper furnished or to be furnished to the publishers in Canada by the manufacturers; and controlling the distribution and delivery of the same.

P.C. 1060, dated the 16th day of April, appointing R. A. Pringle a commissioner to conduct an inquiry into and concerning the manufacture, sale, price and supply of newsprint paper within the Dominion of Canada. Presented by Sir Thomas White, April 26, 1917.. .. ..*Not printed.*

115. P.C. 3412, dated the 19th day of December, 1917, concerning the appointment of Mr. S. A. Armstrong as Director of the Military Hospitals Commission. Presented by Sir Thomas White. April 26, 1917.. .. ..*Not printed.*

116. Return to an Order of the House of the 3rd February, 1917, for a return showing the names and post office addresses of all purchasers of fish scrap from the reduction works at Canso in 1916, showing the price paid by each of said purchasers. Presented April 26, 1917.—*Mr. Sinclair*.. .. ..*Not printed.*

117. Return to an address to His Excellency the Governor General of the 23rd April, 1917, for a copy of the Order in Council increasing the toll rates on Victoria bridge, Montreal, and also a copy of all petitions, telegrams, letters and other documents referring to said increase. Presented April 30, 1917.—*Mr. Lemieux*.. .. ..*Not printed.*

118. Return to an Order of the House of the 23rd April, 1917, for a copy of all letters, telegrams, petitions and all other papers concerning the substitution of the name of Luceville given to the Intercolonial Railway Station of Ste. Luce, County of Rimouski, Quebec. Presented April 30, 1917.—*Mr. Lemieux*.. .. ..*Not printed.*

119. Return to an Order of the House of the 31st January, 1917, for a copy of all vouchers, correspondence, etc., in connection with the repairs to Beaver Harbour Wharf, Halifax County, within the last four years. Presented April 30, 1917.—*Mr. McLean (Halifax).* *Not printed.*

120. Return to an Order of the House of the 31st January, 1917, for a copy of all correspondence, vouchers, etc., in connection with the repairs to Harrigan Cove Wharf, Halifax County, in 1914-15, under the foremanship of James McDonald. Presented April 30, 1917.—*Mr. McLean (Halifax)*.. .. ..*Not printed.*

121. Supplementary return to an Order of the House of the 16th February, 1916, for a return showing:—1. The amounts expended in Railway Subsidies in Canada during the years 1912, 1913, 1914 and 1915. 2. The amounts by provinces, and the names of the lines to which granted. 3. Amounts expended on the construction of Government-owned railways in Canada during the above years. 4. The amount expended in each province, and the name of the line of railway on which such expenditure was made. 5. Amounts expended on harbour and river improvements in Canada during the above years. 6. The amounts by provinces and the particular places where expended. 7. Amounts expended on the building of public wharves, public breakwaters, and public dredging in North Cape Breton and Victoria during the years 1905 to 1911, inclusive, including the expenditure on Government railways. 8. Amounts expended for like purposes in the said county, during the years 1912, 1913, 1914 and 1915. Presented April 30, 1917.—*Mr. McKenzie*.. .. ..*Not printed.*

122. Return to an Order of the House of the 19th April, 1916, for a copy of all letters, petitions, correspondence and telegrams exchanged between the Government, its district engineer,

CONTENTS OF VOLUME 21—*Continued.*

and all other persons, concerning either the construction or repairing or purchase of the wharves at the following places: Ile Perrot Sud, the Church in the Village of Ile Perrot, the Village of Vaudreuil, Pointe Cavagnal, Hudson, Rigaud, Graham, Pointe Fortune, and Ile Perrot Nord. Also, a copy of all specifications and reports already brought down at my request in relation to the documents prior to and since 1904, and a statement of the amounts that have been paid for such construction or repairs, and to whom they were paid. Presented April 30, 1917.—*Mr. Boyer*.. .. ..*Not printed.*

122a. Return to an Order of the House of the 16th February, 1916, for a copy of all letters, petitions, correspondence, telegrams and reports, exchanged between the Government, the engineers residing in the district, and all other persons, concerning the construction and repairing done to the wharves mentioned below, since 1904, and of all data and reports already produced at my request and relating to documents prior to 1904; also the amounts of money paid for such construction and repairing, and to whom paid:—The wharf at Ile Perrot North, South, and at the Church; of the Village of Vaudreuil; of Pointe Cavagnal; of Hudson; of Graham; of Rigaud, and of Pointe Fortune. Presented April 30, 1917.—*Mr. Boyer*.. .. ..*Not printed.*

122b. Return to an Order of the House of the 30th April, 1917, for a copy of all letters, petitions, correspondence, telegrams and reports exchanged between the Government, the resident engineer and all other persons, concerning the construction and repairing done to the wharves at Ile Perrot North, South and at the Church; Village of Vaudreuil, Pointe Cavagnal, Hudson, Graham, Rigaud and Point Fortune since 1904. Also, a copy of all data and reports regarding above already produced at my request relating to documents prior to 1904, showing the amounts of money paid for such construction and repairing, and to whom paid. And also, return to an Order of the House of the 30th April, 1917, for a copy of all letters, petitions, correspondence and telegrams exchanged between the Government, the district engineer, and any other persons concerning either the construction, repairing or purchase of the wharves at Ile Perrot South, the Church in the Village of Ile Perrot, Village of Vaudreuil, Pointe Cavagnal, Hudson, Rigaud, Graham, Pointe Fortune and Ile Perrot North, since 1904. Also a copy of all specifications and reports already brought down at my request in relation to above prior to, and since 1904, giving a statement of the amounts that have been paid for such construction or repairs, showing to whom they were paid. Presented August 13, 1917.—*Mr. Boyer*. *Not printed.*

123. Return to an Order of the House of the 19th April, 1916, for a copy of all letters, petitions, correspondence and telegrams exchanged between the Government, its resident engineer, and all other persons, concerning the dredging work done at the following places:—Ste. Anne de Bellevue, Pointe Fortune, Ottawa River Channel between Ile au Foin and Ile à Paquin, Graham channel, Rigaud channel, Hudson Heights channel, Hudson, Como, Pointe Cavagnal, channel at Vaudreuil Village, Dorion Bay channel, Ile Perrot Church, Ile Perrot Sud Wharf, and Ile Perrot Nord Wharf. Also, a statement of the amounts paid to different persons, companies, etc., for such work, the dates, etc., and a copy of the estimates already brought down at my request, the whole since 1904. Presented April 30, 1917.—*Mr. Boyer*.. .. ..*Not printed.*

123a. Return to an Order of the House of the 16th February, 1916, for a copy of all letters, petitions, correspondence, telegrams and reports exchanged between the Government, the resident engineer of the district, and all other persons, concerning the dredging work done at the places below named, and the amount of money paid to divers, persons companies, etc., for such work, as well as the statements already presented at any request, the whole since 1904:—At the wharf of Ile Perrot, North, South and at the Church; in Dorion Bay channel; at Vaudreuil Village channel; at Pointe Cavagnal; at Como; at Hudson; at Hudson Heights channel; at Graham channel; in the Rigaud River channel; in the Ottawa river; Ile aux Poires channel; at Pointe Fortune, and at Ste-Anne de Bellevue channel. Presented April 30, 1917.—*Mr. Boyer*.. .. .. ..*Not printed.*

124. Return to an Order of the House of the 3rd May, 1916, for a copy of all letters, telegrams, bills, vouchers and memoranda in connection with the repairs to the wharf at Upper Prospect, Halifax County, N.S., in 1915. Presented April 30, 1917.—*Mr. McLean (Halifax)*.. .. ..*Not printed.*

CONTENTS OF VOLUME 21—*Continued.*

125. Return to an Order of the House of the 3rd May, 1916, for a copy of all letters, telegrams, bills, vouchers and memoranda in connection with the repairs to the wharf at Shad Bay, Halifax County, N.S., in 1915. Presented April 30, 1917.—*Mr. McLean (Halifax)* . . . . *Not printed.*

126. Return to an Order of the House of the 1st February, 1917, for a copy of all correspondence in the possession of the Department of Public Works bearing date after September, 1911, relating to the expenditure of money voted last session for harbour improvements at Tracadie, in the County of Antigonish, including copies of all letters relating to the same written by Mr. G. A. R. Rollings to the said Minister of Public Works or to any other member of the Government. Presented April 30, 1917.—*Mr. Sinclair.* . *Not printed.*

127. Return to an Order of the House of the 3rd February, 1917, for a copy of all letters, telegrams, reports and other documents received by the Government during the years 1915 and 1916, relative to the repairs required on the breakwater at Souris, P.E.I. Presented April 30, 1917.—*Mr. Hughes (Kings, P.E.I.)* . . . . *Not printed.*

128. Return to an Order of the House of the 1st February, 1917, for a copy of all correspondence in the possession of the Department of Public Works bearing date after September, 1911, relating to the extension of a breakwater at Breen's Point, in the County of Antigonish. Presented April 30, 1917.—*Mr. Sinclair* . . . . *Not printed.*

129. Return to an Order of the House of the 31st January, 1917, for a copy of all correspondence, vouchers, etc., in connection with the construction of the Mushaboom Harbour Wharf, Halifax County, in 1913. Presented April 30, 1917.—*Mr. McLean (Halifax)* . . . . *Not printed.*

130. Return to an Order of the House of the 31st January, 1917, for a return showing all expenditures made since March 31, 1916, by the Public Works Department in the several provinces of Canada, specifying the name of the work, the amount already spent thereon, and the estimated total expenditure in each case. Presented April 30, 1917.—*Mr. McLean (Halifax)* . . . . *Not printed.*

131. Return to an Order of the House of the 31st January, 1917, for a copy of all correspondence, vouchers, etc., in connection with the construction of the Port Dufferin West Wharf, Halifax County, in 1913-14. Presented April 30, 1917. —*Mr. McLean (Halifax).* *Not printed.*

132. Return to an Order of the House of the 31st January, 1917, for a copy of all correspondence, vouchers, etc., in connection with the repairs to the Port Dufferin East Wharf, Halifax County, in 1915. Presented April 30, 1917.—*Mr. McLean (Halifax).* *Not printed.*

133. Return to an Order of the House of the 31st January, 1917, for a copy of all correspondence, vouchers, etc., in connection with the construction of a wharf at Ecum Secum West, Halifax County. Presented April 30, 1917.—*Mr. McLean (Halifax)* . . . . . *Not printed.*

134. Return to an Order of the House of the 27th March, 1916, for a copy of all correspondence, letters, telegrams, etc., in any way referring to the dredging at Margaree Harbour, Inverness County, N.S., during 1913, 1914, 1915 and 1916. Presented April 30, 1917.—*Mr. Chisholm* . . . . *Not printed.*

135. Copy of Order in Council, P.C. 1142, dated the 24th day of April, 1917, under the provisions of the War Measures Act, 1914, containing regulations under which British ships registered in Canada, or under construction for neutral owners, may until further order be requisitioned by His Majesty for the carriage of foodstuffs, etc., or for any purpose whatsoever; and cancelling Orders in Council, P.C. 2923, dated the 24th day of November 1916, and P.C. 1915, dated the 31st day of March, 1917, in respect thereto. Also certified copy of a report of the Committee of the Privy Council, approved by His Excellency the Governor General on the 30th day of January, 1917, respecting the exercise of the requisitioning power by His Majesty's Government in the case of Canadian vessels. Presented by Hon. Mr. Reid, April 30, 1917. . . . . *Not printed.*

CONTENTS OF VOLUME 21—*Continued.*

CONTENTS OF VOLUME 21—*Continued.*

258. Return to an Order of the House of the 18th June, 1917, for a copy of all accounts, papers, claims and correspondence regarding demands put forward by all persons who have claimed to have sustained loss or damage by the fire in the Parliament Buildings in February, 1916. Presented August 21, 1917.—*Mr. Lanctôt*.. .. ..*Not printed.*

259. Return to an Order of the House of the 14th May, 1917, for a copy of all communications, letters, reports, petitions and other documents on behalf of the Physicians and Medical Associations of this country, asking for the repeal of The Proprietary or Patent Medicine Act and the presentation of a new Act on the matter in order to render more efficient the control of these medicine preparations, and to add on the prohibition list such drugs or medicines as are generally dangerous to health and conducive to certain criminal practices. Presented August 21, 1917.—*Mr. Lapointe (Kamouraska).*

Not printed.

260. Copy of correspondence between the Honourable Robert Rogers and the Right Honourable Sir Robert Borden, Prime Minister, with reference to the resignation of the former as Minister of Public Works of Canada.—(*The Senate.*).. .. ..*Not printed.*

261. Return to an Order of the Senate dated the 11th day of July, 1917, for a Statement showing the number of officers and men of the Canadian Expeditionary Force who have been classed as unfit for military service; whether the military authorities have given consideration to the possibility of utilizing the services of those men in a secondary capacity; whether those who have been classed as unfit continue to draw military pay; the number who have deserted from the various units between 1st October, 1914, and 1st June, 1917; and the number discharged from the various units since 1st October, 1914.—(*The Senate.*).. .. ..*Not printed.*

262. Return to an Order of the Senate, dated 7th June last, for a return showing:—1. The name and rank of each person who at the outbreak of the war in August, 1914, was an officer, commissioned or provisional, of the 78th Regiment (Highlanders), of Pictou County, Nova Scotia. 2. The length of time each of such persons was attached to said regiment. 3. (*a*) The name of each of said officers who joined the Canadian Overseas Forces. (*b*) The unit to which he was attached. (*c*) The rank with which he was attached. (*d*) The date at which he was attached. 4. The name of each person who since the outbreak of war became attached as provisional officers to said 78th Regiment and the date at which such person became attached and his rank. 5. (*a*) The name of each of the officers referred to in paragraph 4 who joined the Canadian overseas forces. (*b*) The unit to which he was attached. (*c*) The rank with which he was attached. (*d*) The date at which he was attached. 6. The name of each of the officers referred to in each of the foregoing paragraphs who were in active service at the fighting front, the units with which they served, and the length of time they served. 7. Particulars as to each of the said officers showing where each one was on May 1, 1917, to what unit he was attached, and what his rank was at that time. 8. If any of these officers have gone to the fighting front since May 1, state name, unit, rank and date.—(*The Senate.*)

Not printed.

263. Part return to an humble Address of the Senate to His Excellency the Governor General, dated the 8th instant, showing all the correspondence between the Department of Militia and Defence and Clarence J. McCuaig; also, between the same and the first Purchasing Committee appointed by Sir Robert Borden, of which the Honourable Robert Rogers was Chairman, and between the said Clarence J. McCuaig and the Committee of which the Honourable Sir Edward Kemp is or was Chairman, or with any of the members of the said committee.—(*The Senate.*).. .. ..*Not printed.*

264. Eighth Annual Report of the Commission of Conservation for the fiscal year ending 31st March, 1917. Presented by Hon. Mr. Burrell, September 1, 1917.. .. ..*Not printed.*

265. Return to an Order of the House of the 30th August, 1917, for a return showing:—1. The number of additional buildings and offices that have been rented by the various departments of the Government in the City of Ottawa during the calendar years, 1914, 1915, 1916 and 1917. 2. The names of the lessors, the length of the lease and the respective rentals of said buildings. 3. What department in each case is occupying said premises. Presented September 3, 1917.—*Mr. Sinclair*.. .. ..*Not printed.*

CONTENTS OF VOLUME 21—*Continued.*

266. Return to an Order of the House of the 11th July, 1917, fo a copy of all correspondence and other documents relating to the granting to beam trawlers registered in the United States the privilege of using ports in the Province of Nova Scotia for the purchasing of supplies, the shipping of men, etc., without license therefor as required under the modus videndi. Presented September 3, 1917.—*Mr. Kyte*.. .. ..*Not printed.*

267. Copy of contract dated 8th Mareh, 1917, between His Majesty the King and Wallace Shipyards, Limited, for the construction and delivery of one wooden auxiliary sailing ship. Also,—Copy of contract dated 1st June, 1917, between His Majesty the King and Lamond and Harrison for the construction and delivery of one wooden auxiliary sailing ship. Presented by Hon. Mr. Coehrane, September 3, 1917.. .. ..*Not printed.*

268. Return to an Order of the Senate, dated the 15th day of June last, for a return made to an Order of the House of Commons, of the 7th February, 1916, for a copy of all correspondence and reports on the claims of Sealers of British Columbia under the last treaty with the American Republic, and all papers connected therewith.—(*The Senate.*)
Not printed.

269. Copy of Order in Council, P.C. 2245, dated 3rd September, 1917, appointing the Deputy Minister of Justice, Oliver Mowat Biggar, of the City of Edmonton, John H. Moss, of the City of Toronto, Louis Loranger, of the City of Montreal, and Lt.-Col. H. A. C. Machin, of the Town of Kenora, Ont., a council to advise and assist in the administration and enforcement of the Military Service Act, 1917, to be known as the Military Service Council. Presented by Sir Robert Borden, September 4, 1917.. ..*Not printed.*

270. Return to an Order of the House of the 21st May, 1917, for a copy of all reports, letters, telegrams, correspondence and any other papers in connection with the question of locating the 210th Battalion at Regina and Moosejaw respectively during the winter of 1916-17. Presented September 6, 1917.—*Mr. Knowles*.. .. . .*Not printed.*

271. Return to an Order of the House of the 14th May, 1917, for a copy of all letters, correspondence, telegrams and reports received by the Government since September, 1911, to the present day, in any way referring to the appointment of a man in charge of the storm signals at Grand Etang and Margaree Harbour. Presented September 6, 1917.—*Mr. Chisholm*.. .. ..*Not printed.*

272. Return to an Order of the House of the 7th May, 1917, for a return showing the different rural mail routes established in the constituency of Qu'Appelle since the 1st day of January, 1916, showing their location and date of establishment. Also, a list of all rural mail routes now being established or under consideration at the present time in the same constituency. Presented September 7, 1917.—*Mr. Thomson* (*Qu'Appelle*).
Not printed.

273. Return to an Order of the House of the 6th March, 1916, for a copy of all telegrams, letters, petitions and documents of all kinds in any way referring to the change in the Inverness-Margaree mail route from the west to the east of the Margaree river, from a point at Margaree Forks to Chapel Bridge. Presented September 7, 1917.—*Mr. Chisholm*.. .. ..*Not printed.*

274. Copy of Order in Council, P.C. 2199, dated 10th August, 1917: Rules and Regulations enacted in lieu of the Classification, Rules and Regulations contained in Order in Council, P.C. 1296, of the 15th May, 1917, in respect to War badges for members of the Canadian Expeditionary Force. Presented by Sir Edward Kemp, September 13, 1917.
Not printed.

275. Copy of Order in Council, P.C. 2552, dated 13th September, 1917, recommending that Certificates of Naturalization may be issued under the Naturalization Act, 1914, to alien enemies who have resided for many years in Canada, on its being shown that they are clearly in sympathy with the United Kingdom and its allies in the present war, and that they have no pro-German or other alien enemy alliliations or connections. Presented by Sir Robert Borden, September 14, 1917.. .. ..*Not printed.*

CONTENTS OF VOLUME 21—*Concluded.*

276. Copy of *Canada Gazette* dated 12th September, 1917, containing a list and location of Local Tribunals established to hear and decide applications for certificates of exemption from Military Service. Presented by Hon. Mr. Doherty, September 14, 1917.
Not printed.

277. Copies of Orders in Council, dated 15th September and 17th September, 1917, respectively, appointing Registrars for the Provinces of British Columbia, New Brunswick, Quebec, Saskatchewan, Manitoba, Ontario, Alberta and Prince Edward Island, under the provisions and for the purposes of the Military Service Act, 1917. Presented by Sir Robert Borden, September 17, 1917.. .. ..*Not printed.*

278. Return to an Address to His Excellency the Governor General of the 2nd May, 1917, for a copy of all Orders in Council, letters, telegrams, etc., to or from any employee of the Government in reference to the improvement and equipment of the life-saving station at Whitehead, Guysborough County, N.S. Presented September 17, 1917.—*Mr. Maclean (Halifax)*.. .. ..*Not printed.*

279. Return to an Order of the House of the 14th May, 1917, for a copy of all letters, petitions, correspondence, telegrams and reports received by the Government since September, 1911, to the present day, in any way referring to the dredging and building of piers at Mabou Harbour. Presented September 19, 1917.—*Mr. Maclean (Halifax)*.
Not printed.

280. Return to an Order of the House of the 13th August, 1917, for a return showing:—1. The different amounts paid for commissions and expenses in connection with the flotation of the different loans made by Canada since 1914. 2. The respective amounts paid in connection with each loan. Presented September 19, 1917—*Mr. Macdonald.*
Not printed.

281. Return to an Order of the House of the 5th September, 1917, for a copy of all correspondence, letters, telegrams, petitions, etc., in any way referring to an application for a public wharf at Chimney Corners, Inverness County, N.S. Presented September 19, 1917.—*Mr. Chisholm*.. .. ..*Not printed.*

282. Return to an Order of the House of the 29th August, 1917, for a return showing copies of all accounts, memoranda, vouchers, telegrams, letters, etc,. in reference to payments to George H. Boyce, of Windsor, N.S., District Foreman of Public Works Department, since his appointment to office. Presented September 19, 1917.—*Mr. Maclean (Halifax)*.
Not printed.

283. Return to an Order of the Senate dated the 1st day of March, 1916, showing a copy of all correspondence between the Government and the British Columbia Boards of Trade, and also between the Government and the Canadian Manufacturers' Association, in reference to the request made by the British Columbia Boards of Trade for the appointment of a Dominion Customs Officer at the Port of New York.—(*Senate.*).
Not printed.

284. Part return to an humble Address of the Senate, dated the 14th of August, 1917, to His Excellency the Governor General, for a return showing the name of every judge of the Supreme, District and County Courts in all the provinces of Canada, for the year 1916, together with a statement of the moneys paid to each of such judges for that year for (*a*) salaries; (*b*) travelling expenses; (*c*) allowances of all kinds; (*d*) for services as Commissioners; (*e*) and any other payments; and also, showing the names of judges who have performed services as Commissioners, or in any other public capacity without compensation.—(*Senate.*).. .. ..*Not printed.*

285. Return to an humble Address of the Senate, dated the 9th August, 1917, to His Excellency the Governor General, showing all the documents relating to the purchase by the Militia Department of "Bonnie Bel Air" from W. T. Rodden, Esq., a part of number nine (9) on the official plan and book of reference of the Parish of Lachine and specially the report of the lawyers who examined the titles.—(*Senate*).. .. ..*Not printed.*

DEPARTMENT OF THE INTERIOR—CANADA
Hon. W. J. ROCHE, Minister, W. W. CORY, Deputy Minister.
DOMINION WATER POWER BRANCH,
J. B. CHALLIES, C.E., Superintendent.

WATER RESOURCES PAPER No. 18.

REPORT

OF THE

BRITISH COLUMBIA HYDROMETRIC SURVEY

FOR

The Calendar Year 1915

BY

R. G. SWAN, B.A. Sc.
Chief Engineer

Prepared under the direction of the Superintendent of Water Power.

OTTAWA.
PRINTED BY J. DE L. TACHÉ,
PRINTER TO THE KING'S MOST EXCELLENT MAJESTY
1917.

To Field Marshal His Royal Highness Prince Arthur William Patrick Albert, Duke of Connaught and of Strathearn, K.G., K.T., K.P., etc., etc., etc., Governor General and Commander in Chief of the Dominion of Canada.

MAY IT PLEASE YOUR ROYAL HIGHNESS:

The undersigned has the honour to lay before Your Royal Highness the British Columbia Hydrometric Survey Report for 1915.

Respectfully submitted,

W. J. ROCHE,

Minister of the Interior.

OTTAWA, May 1, 1916.

DEPARTMENT OF THE INTERIOR,

OTTAWA, May 1, 1916.

The Honourable W. J. Roche, M.D.,

Minister of the Interior.

SIR,—I have the honour to submit the British Columbia Hydrometric Survey Report for 1915, and to recommend that it be published as Water Resources Paper No. 18 of the Dominion Water Power Branch.

I have the honour to be, sir,

Your obedient servant,

W. W. CORY,

Deputy Minister of the Interior.

DEPARTMENT OF THE INTERIOR, WATER POWER BRANCH,

OTTAWA, May 1, 1916.

W. W. Cory, Esq., C.M.G.,

Deputy Minister of the Interior.

SIR,—I have the honour to submit the attached report by R. G. Swan, B.A.Sc., Chief Engineer of the British Columbia Hydrometric Survey.

In view of its important bearing on the industrial development of southern British Columbia, I would recommend that it be published as Water Resources Paper No. 18 of the Dominion Water Power Branch.

Respectfully submitted,

J. B. CHALLIES,

Superintendent, Dominion Water Power Branch.

OTTAWA, May 1, 1916.

J. B. Challies, Esq., C.E.,

Superintendent,
Dominion Water Power Branch,

Department of the Interior,
Ottawa.

SIR,—I have the honour to transmit herewith my Annual Report of the British Columbia Hydrometric Survey for the calendar year 1915, together with the reports of engineers in charge of divisions.

Your obedient servant,

R. G. SWAN,
Chief Engineer.

REPORT

OF THE

BRITISH COLUMBIA HYDROMETRIC SURVEY FOR 1915.

CHAPTER I.

REPORT OF R. G. SWAN, B.A.Sc.

CHIEF ENGINEER.

CHAPTER I.

REPORT OF THE CHIEF ENGINEER.

SCOPE OF WORK.

In addition to maintaining the stream measurement work previously established in the nine districts of the southern part of the province, the field of operations has been extended to include that part of central British Columbia opened up for settlement and development by the completion of the Grand Trunk Pacific Railway. The work in this district was only commenced in May of 1915 and the few stations established were installed at the request of parties who expected to utilize the water in the near future.

Practically no extension of the work has been made in the other districts, the men and funds available being only sufficient for that already established.

The work during the past year has supplied additional information which necessitates the revising of much data which the urgency of the requests of engineers and others in previous years had induced the survey to supply. These revisions are being carefully gone into and I would recommend that a hydrometric bulletin including all such data acquired since the commencement of the survey be published at the end of the year.

Co-operation with the British Columbia Lands Branch and the Dominion Parks Branch has been continued, investigations being made and reports submitted on the following,—applications for lease of foreshore lands for the purpose of removing sand and gravel, for the purchase of lands under irrigation conditions, for the setting aside of certain lands for the protection of the water supply, for the reserving from settlement of certain lands for storage purposes in connection with irrigation, and other applications of a general nature.

In connection with a hydrometric bulletin which the Provincial Water Rights Branch proposed to publish, complete flow data was supplied that Branch in October for the period January 1, to September 30, 1915. The furnishing of the data at that time involved a very considerable extra amount of work, the staff having been so depleted by the members enlisting for overseas service that it was necessary to bring some of the field engineers into the office to assist in the compilation.

Mutual benefit has been derived by the continued co-operation between the Provincial Water Rights Branch and this Survey.

The Conservation Commission of Canada has again been furnished with all the hydrometric data required in connection with its forthcoming report on the water powers of British Columbia. Every effort has been made to secure the information requested by the Commission during the year.

ORGANIZATION.

The methods of collecting and compiling the data for publication in the Annual Stream Measurement report were similar to those of previous years and have been described fully in other reports.

The division of the territory covered by the survey into districts in 1914, and described in Water Resources Paper No. 14, was found to be suitable and economical and was adhered to in 1915, but the changes in staff due to the war, made it impossible to allot an engineer specially to each district.

At the commencement of the year the staff consisted of the chief engineer, three division engineers, eight assistant engineers, one accountant, two clerical assistants and two stenographers. During the year six of the staff enlisted for active service and only three appointments were made. It is considered that, under the circumstances, the best possible rearrangement of the work was made.

Coast Division.

As in 1914 Messrs. Cline, Webb and Hughes were in charge of the field work in the Southern, Vancouver Island and Lillooet districts respectively. In September Mr. Cline was transferred to Kamloops to take charge of the Kamloops division when Mr. Dann enlisted for active service. For the remainder of the year what little field work was required in the southern district was looked after by Mr. Hughes.

The computations of the data for the Annual report were made by Messrs. Webb and Hughes and checked by Mr. Balls, the office engineer.

Coast Division. List of Regular Gauging Stations, Southern District.

Station Number.	Stream.	Location.
1000	Belknap	Tp. 6, Rge. 7, W. 7 M.

1021	Brandt	Tp. 7, Rge. 7, W. 7 M.
1023	Capilano	Near North Vancouver.
1003	Chehalis	Tp. 4, Rge. 30, W. 6 M.
1004	Chilliwack	Tp. 23, E. C. M.
1005	Coquihalla	Tp. 5, Rge. 26, W. 6 M.
1066	Coquitlam	Tp. 39, W. C. M.
1062	Flume	Six miles from head of Burrard Inlet.
1007	Fraser	Tp. 5, Rge. 26, W. 6 M.
1064	Hixon	Tp. 6, Rge. 7, W. 7 M.
1010	Jones	Tp. 3, Rge. 27, W. 6 M.
1046	Lynn	Near North Vancouver.
1011	Mesliloet	Tp. 7, Rge. 7, W. 7 M.
1058	Nicolum	Tp. 4, Rge. 5, W. 6 M.
1013	Norton	Tp. 7, Rge. 7, W. 7 M.
1022	Seymour	Near North Vancouver.
1017	Silver-Pitt	Tp. 4, Rge. 5, W. 7 M.
1055	Skagit	Forty miles south from Hope.
1018	South Lillooet	Tp. 12, E. C. M.
1056	Sumallo	Near Railway Belt boundary.
1057	Sumallo	Tp. 3, Rge. 24, W. 6 M.
1020	Young	Tp. 7, Rge. 7, W. 7 M.

Note:—All stations in Provincial Water District No. 1.

Except for the establishment of the station on Flume creek and the discontinuance of the stations on Black and Slollicum creeks, where the gauge readings were so infequent as to render the records of little value, no changes were made in the district during 1915.

The majority of the stations in the district have been established at the request of parties interested in the flow records, and in several cases they are co-operating with the department in the matter of expenditures in connection with the maintenance of the stations.

Open water conditions prevail on the majority of the rivers in the district, and as the conditions governing the control are for the most part permanent, the field work in connection with the maintenance of the stations is becoming less each year, now that the stations are well rated.

Coast Division. List of Regular Gauging Stations, Lillooet District.

Station Number.	Stream.	Location.
1065	Brandywine	Near Brew—One mile above mouth.
1045	Bridge	Ten miles from Shalaith—Thirty miles above mouth.
1048	Cayuse	Near Lillooet—Above Seton creek.
1034	Cheakamus	Near Cheekye.
1074	Foster Bar	Twenty-three miles south from Lillooet.
1047	Fountain	Near Lillooet—One mile above mouth.
1072	Fraser	At Lillooet.
1035	Green	Near Pemberton—Above Nairn falls.
1050	Laluwissin	Sec. 30, Tp. 27, Rge. 17, W. 6 M.
1038	Lillooet	Near Pemberton.
1073	Pavilion	Near Pavilion.
1049	Seton	Near Lillooet—Below Seton lake.
1061	Sixmile	At mouth, near Tisdale, B.C.
1037	Soo	One mile above mouth, near Tisdale.
1044	Texas	Fourteen miles south from Lillooet.

Note:—All stations in Provincial Water District No. 1.

In addition to maintaining the stations established in this district prior to 1915, others were established on Brandywine, Foster Bar, Fraser and Pavilion rivers.

While the minimum discharge of Brandywine river is rather small, about 600 horse power could be developed very cheaply and used as a temporary power plant until a larger development on the Cheakamus river is required.

The stations on Foster Bar and Pavilion creeks have been established in connection with irrigation studies. The Fraser river benches adjacent to the mouth of Foster Bar creek, when irrigated, are well suited to cultivation. At present the normal flow of the creek is being used for this purpose. So far no investigations have been made with a view to storing the high water flow. A small dam at the outlet of Pavilion lake stores a portion of the spring and early summer freshets and this water is released as required by the irrigators along the river.

Owing to the old gauge on the Fraser river at Lytton being affected by backwater from the Thompson river, the station was abandoned and a new station established at Lillooet, where measurements are secured from the Pacific Great Eastern Railway bridge.

Coast Division. List of Regular Gauging Stations, Vancouver Island District.

Station Number.	Stream.	Location.
1032	Big Qualicum	One and a half mile above mouth.
1042	Campbell	At Campbell lake.
1027	Chemainus	One mile above mouth, near Chemainus.
1054	Cowichan	At Cowichan lake.
1030	Englishmans	One and one-half mile above mouth, near Parksville.
1029	Haslam	Two miles above mouth, near Ladysmith.
1026	Koksilah	Two miles above mouth, near Duncan.
1031	Little Qualicum	At Cameron lake, B.C.
1028	Nanaimo	Six miles above mouth.
1040	Oyster	One mile above mouth.
1036	Puntledge	One mile above mouth, near Courtenay.
1063	Puntledge	Diversion dam, above Canadian Collieries Power Plant.
1025	Shawnigan	At Shawnigan lake, Koenigs, B.C.
1051	Sproat	At Sproat lake.
1052	Stamp	At Great Central lake.
1053	Stamp	One-half mile above Stamp falls.
1039	Tsolum	Three miles above mouth, near Courtenay.

Note:—All stations in Provincial Water District No. 1.

Stations were established in 1914 on those rivers which were considered of the most importance and with the exception of the station on Campbell river no change was made in the district during 1915.

Owing to the difficulty in securing accurate measurements from a boat, during high water on the Campbell river, a cable and car were installed in May and the station was fairly well rated during the season. The Campbell River Power Company co-operated in the matter of expenditure in the installation of cable and car.

Although the Campbell River Power Company was in possession of the daily gauge records of four gauges on the river since 1910, none of these gauges had ever been rated. These records were placed at the disposal of this survey and each set has been co-related to its gauge, affording an unbroken record of reliable data since the above mentioned year.

Quinsam	One-half mile above mouth, near Campbell river, B.C.	Prov. Water Dist. No. 1.

KAMLOOPS DIVISION.

The number of changes in the staff of the Kamloops division due to the men enlisting for active service overseas, has made the field and office work exceedingly heavy for the remaining staff. For the greater part of the year the field work in the three districts of the division was carried on by two engineers.

The computations of the data for the annual report were made by Messrs. Tredcroft and McNaughton and checked by the division engineer.

2043	Tranquille	Tp. 20, Rge. 19, W. 6 M.	Prov. Water Dist. No. 2
2066	Whitewood	Near Barriere	Prov. Water Dist. No. 2

The stream measurement work in the Kamloops district is principally on irrigation streams where the frequent shortage of water demands accurate gauging so that the apportioning of water to the various users may be efficiently done.

In establishing and maintaining these stations the requirements of the Water Rights Branch of the Provincial Government are very closely followed.

The stations on Edwards creek and Salmon river, which had been discontinued, were re-established in 1915 at the request of the Water Rights Branch.

On the Barriere, Clearwater, Murtle, Little Clearwater and Raft rivers the stations are maintained in connection with water power projects.

The city of Kamloops has a small power plant in operation at the present time on the Barriere river.

The splendid opportunities for the development of power on the Murtle river warranted the establishment of an automatic water stage register and a cable car to ensure frequency of gauge records and accuracy of meter measurements.

On the North Thompson a station was established on the new highway bridge near Barriere, as the old station above Jamieson creek was found to be expensive and difficult to maintain.

2061	Seymour	Head of Seymour arm, Shuswap lake Prov. Water Dist. No. 2.
2034	Shuswap	Tp. 18, Rge. 9, W. 6 M. Prov. Water Dist. No. 2.
2054	Similkameen	Near Ashnola Prov. Water Dist. No. 4.
2063	South Similkameen	At Princeton Prov. Water Dist. No. 4.
2042	South Thompson	Tp. 21, Rge. 13, W. 6 M. Prov. Water Dist. No. 2.
2062	Tulameen	At Coalmont Prov. Water Dist. No. 5.
2081	Twentymile	Near Hedley Prov. Water Dist. No. 4.

Chase, Manson and Niskonlith creeks are used for irrigation.

In this district a number of other irrigation streams which are outside the Dominion railway belt are being measured by the Provincial Water Rights Branch.

Records are being kept on Brash creek in co-operation with the city of Enderby for municipal water supply and power purposes.

Most of the other stations in the Okanagan district are maintained on account of water power possibilities.

On Adams river a Gurley water stage register has been in operation all year and the results have been most satisfactory. No ice troubles were experienced although the weather was unusually cold.

A car and cable were installed in April, 1915, on the Seymour river and the station was consequently fairly well rated during the season, so that the gauge readings obtained in 1914 as well as those in 1915 were made available for determining the flow of the stream.

The car on the Seymour river is located on one of the trails up the river and is used as a ferry by ranchers and others who have occasion to use the trail. A similar use is made of the car on the Murtle river, in the Kamloops district, particularly by the rangers of the Provincial Forestry Department.

Kamloops Division. List of Regular Gauging Stations, Ashcroft District.

Station Number.	Stream.	Location.	
2001	Barnes	Tp. 20, Rge. 24, W. 6 M.	Prov. Water Dist. No. 2.
2069	Beaver	North of Nicola lake	Prov. Water Dist. No. 3.
2003	Bonaparte	Tp. 21, Rge. 24, W. 6 M.	Prov. Water Dist. No. 2.
2071	Cache	Tp. 21, Rge. 24, W. 6 M.	Prov. Water Dist. No. 2.
2072	Cache, diversion to Eightmile	Tp. 22, Rge. 24, W. 6 M.	Prov. Water Dist. No. 2.
2006	Coldwater	At Merritt	Prov. Water Dist. No. 3.
2007	Criss	Tp. 22, Rge. 22, W. 6 M.	Prov. Water Dist. No. 2.
2008	Deadman	Tp. 22, Rge. 22, W. 6 M.	Prov. Water Dist. No. 2.
2016	Hat	Tp. 19, Rge. 26, W. 6 M.	Prov. Water Dist. No. 2.
2027	Nahatlatch	Tp. 12, Rge. 26, W. 6 M.	Prov. Water Dist. No. 1.
2030	Nicola, mouth	Tp. 17, Rge. 25, W. 6 M.	Prov. Water Dist. No. 3.
2029	Nicola, Merritt	At Merritt	Prov. Water Dist. No. 3.
2075	Nicola, Nicola	At Nicola	Prov. Water Dist. No. 3.
2086	Nicola, above Nicola lake	East of Nicola lake	Prov. Water Dist. No. 3.
2037	Spius	Tp. 13, Rge. 23, W. 6 M.	Prov. Water Dist. No. 3.
2039	Thompson, Spences bridge	Tp. 17, Rge. 25, W. 6 M.	Prov. Water Dist. No. 3.

Most of the streams in the Ashcroft district are used for irrigation purposes and the stations on them are only maintained during the irrigation season.

New stations were established on Beaver creek and on the Nicola river, above Nicola lake, at the request of the Provincial Water Rights Branch.

The station on Nicola river, at Nicola, which was established by the Provincial Water Rights Branch in 1913, was transferred to the British Columbia Hydrometric Survey in 1915.

On Cache creek the station had been discontinued, but, at the request of the Provincial Water Rights Branch, it was started again in 1915.

Scottie creek	Tp. 23, Rge. 25, W. 6 M	Prov. Water Dist. No. 2.
Walhachin diversion from Deadman river	Tp. 22, Rge. 22, W. 6 M	Prov. Water Dist. No. 2.

Kamloops Division. Water Level Stations, 1915.

Station Number.	Stream.	Location.
2086	Christina	Near Grand Forks, Prov. Water Dist. No. 5.
2087	Shuswap	Tp. 21, Rge. 8, W. 6 M, Prov. Water Dist. No. 2.
2040	Thompson, Kamloops	Tp. 20, Rge. 17, W. 6 M, Prov. Water Dist. No. 2.

Nelson Division.

In the Nelson division, as in the Coast and Kamloops divisions, two engineers carried on the field work in the three districts after 30th June, when Mr. Elliott was transferred to the Fort George district to replace Mr. Chisholm, who enlisted for active service.

The computations of the data for the annual report were made by Messrs. Dempster and Beeston and checked by the division engineer.

Nelson Division. List of Regular Gauging Stations, Nelson District.

Station Number.	Stream.	Location.
3025	Carpenter	Near Sandon, Prov. Water Dist. No. 6.
3004	Columbia	Near Castlegar, Prov. Water Dist. No. 6.
3008	Columbia	Near Trail, Prov. Water Dist. No. 6.
3066	Duncan	Near Howser, Prov. Water Dist. No. 6.
3070	Fry	Near Johnstons Landing, Prov. Water Dist. No. 6.
3071	Glacier	Near Howser, Prov. Water Dist. No. 6.
3031	Goat	Near Erickson, Prov. Water Dist. No. 6.
3084	Inonoaklin	Near Edgewood, Prov. Water Dist. No. 6.
3029	Kaslo	Near Kaslo, Prov. Water Dist. No. 6.
3022	Kooskanax	Near Nakusp, Prov. Water Dist. No. 6.
3075	Kootenay	Near Bonnington Falls, Prov. Water Dist. No. 6.
3014	Kootenay	Near Glade, Prov. Water Dist. No. 6.
3077	Kootenay	Near Nelson, Prov. Water Dist. No. 6.
3017	Pend d'Oreille	Near Waneta, Prov. Water Dist. No. 6.
3027	Silverton, below mill	Near Silverton, Prov. Water Dist. No. 6.
3028	Silverton, above mill	Near Silverton, Prov. Water Dist. No. 6.
3018	Slocan	Near Crescent Valley, Prov. Water Dist. No. 6.

The station on the Inonoaklin river, established for the study of flow data in connection with a proposed water supply for the town of Edgewood, is the only new station established during the year.

On Nakusp and Sawmill rivers, the stations have been discontinued, the data not being deemed of sufficient importance to warrant the expenditure required to maintain them.

Owing to the difficulty in securing reliable gaugings on the Pend d'Oreille, at Waneta, the division engineer accompanied by Messrs. Hoyt and Parker of the United States Geological Survey, made a reconnaissance trip along the course of the river. The most suitable location for establishing a station was found to be near Metaline Falls, Washington. The station at Waneta was consequently discontinued and we have co-operated with the United States Geological Survey in the establishment of a cable and car at Metaline Falls, and in the maintenance of the station. The Survey's station on the Columbia river, at Trail, was also visited and the United States Geological Survey in turn have co-operated with us in its maintenance. A sounding apparatus, weights and reel, have been sent by Mr. Hoyt for use at Trail during high water, as difficulty has previously been experienced in getting soundings at high stages with ordinary weights.

Nelson Division. List of Regular Gauging Stations, Revelstoke District.

Station Number.	Stream.	Location.	
3000	Akokolex	Tp. 22, Rge. 1, W. 6 M	Prov. Water Dist. No. 8.
3002	Blaeberry	Tp. 28, Rge. 22, W. 5 M.	Prov. Water Dist. No. 8.
3003	Bugaboo	Near Spillimacheen	Prov. Water Dist. No. 8.
3005	Columbia, Golden	Tp. 27, Rge. 22, W. 5 M.	Prov. Water Dist. No. 8.
3007	Columbia, Revelstoke	Tp. 23, Rge. 2, W. 6 M	Prov. Water Dist. No. 8.
3062	Field Springs, No. 1	Tp. 28, Rge. 18, W. 5 M.	Prov. Water Dist. No. 8.
3063	Field Springs, No. 2	Tp. 28, Rge. 18, W. 5 M.	Prov. Water Dist. No. 8.
3064	Field Springs, No. 3	Tp. 28, Rge. 18, W. 5 M.	Prov. Water Dist. No. 8.
3036	Findlay	Near Thunder hill	Prov. Water Dist. No. 8.
3053	Hospital, weir	Tp. 27, Rge. 22, W. 5 M.	Prov. Water Dist. No. 8.
3009	Illecillewaet, Revelstoke	Tp. 23, Rge. 2, W. 6 M	Prov. Water Dist. No. 8.
3030	Incomappleux	Near Beaton	Prov. Water Dist. No. 8.
3011	Kicking Horse, Golden	Tp. 27, Rge. 22, W. 5 M.	Prov. Water Dist. No. 8.
3012	Kicking Horse, Field	Tp. 28, Rge. 18, W. 5 M.	Prov. Water Dist. No. 8.
3013	Kicking Horse, No. 2 tunnel	Tp. 28, Rge. 18, W. 5 M.	Prov. Water Dist. No. 8.
3015	No. 2	Near Wilmer	Prov. Water Dist. No. 8.
3019	Spillimacheen	Near Spillimacheen	Prov. Water Dist. No. 8.
3020	Toby	Near Athalmer	Prov. Water Dist. No. 8.
3032	North Vermilion	Near Edgewater	Prov. Water Dist. No. 8.
3033	South Vermilion	Near Edgewater	Prov. Water Dist. No. 8.
3054	Washout	Near Galena	Prov. Water Dist. No. 8.

The station on Beaver river has been maintained for several years, but as it is not considered of sufficient importance to warrant carrying on further work at this time, the station has been discontinued.

The shifting conditions on Canyon, Illecillewaet, near Glacier, Salmon, Shuswap, Stoddart and Windermere rivers rendered it impossible to secure data sufficiently reliable to compute the daily discharges. The rivers are returned in the Annual Stream Measurement Report under the caption "Miscellaneous" and only the actual meter measurements are given.

With the above exceptions the district is the same as in 1914.

Nelson Division. List of Regular Gauging Stations, Cranbrook District.

Station Number.	Stream.	Location.
3039	Bull	Near Bull river	Prov. Water Dist. No. 7.
3038	Cherry	Near Wasa	Prov. Water Dist. No. 7.
3048	Elk	Near Elko	Prov. Water Dist. No. 7.
3047	Gold	Near Newgate	Prov. Water Dist. No. 7.
3041	Kootenay	Near Wardner	Prov. Water Dist. No. 7.
3045	Linklater	Near Newgate	Prov. Water Dist. No. 7.
3037	Mark	Near Marysville	Prov. Water Dist. No. 7.
3056	Moyie	Near Kingsgate	Prov. Water Dist. No. 7.
3046	Phillips	Near Roosville	Prov. Water Dist. No. 7.
3049	Rock	Near Elko	Prov. Water Dist. No. 7.
3042	Big Sand	Near Jaffray	Prov. Water Dist. No. 7.
3043	Little Sand	Near Jaffray	Prov. Water Dist. No. 7.
3050	St. Marys	Near Wycliffe	Prov. Water Dist. No. 7.

With the exception of the discontinuance of Mud creek no other change has been made in the district since 1914.

This district was not extended during the year as we had hoped, the number of men enlisting for active service made it impossible to look after any more work than in 1914. Measurements were obtained, however, at stages suitable for improving the curves, and ice measurements were secured on streams with power possibilities.

Nelson Division. List of Miscellaneous Gauging Stations.

NELSON DISTRICT.

Stream.	Location.
Eagle creek	Near Edgewood	Prov. Water Dist. No. 6.
Giveout creek	Near Nelson	Prov. Water Dist. No. 6.
Hall creek	Near Halls siding	Prov. Water Dist. No. 6.
Whatshan creek, above Barnes	Near Needles	Prov. Water Dist. No. 6.
Whatshan creek, below Barnes	Near Needles	Prov. Water Dist. No. 6.
Cariboo creek	Near Burton City	Prov. Water Dist. No. 6.
Carpenter creek	Near New Denver	Prov. Water Dist. No. 6.
Lardeau river	Near Howser	Prov. Water Dist. No. 6.
Slocan river	Near Slocan City	Prov. Water Dist. No. 6.
Wilson creek	Near Roseberry	Prov. Water Dist. No. 6.

REVELSTOKE DISTRICT.

Horsethief creek	Near Wilmer	Prov. Water Dist. No. 8.
Illecillewaet river	Near Glacier	Prov. Water Dist. No. 8.
Salmon river	Near Beaton	Prov. Water Dist. No. 8.
Shuswap creek	Near Athalmer	Prov. Water Dist. No. 8.
Stoddart creek	Near Athalmer	Prov. Water Dist. No. 8.
Sinclair creek	Near Radium Hot Springs	Prov. Water Dist. No. 8.
Windermere river	Near Windermere	Prov. Water Dist. No. 8.

CRANBROOK DISTRICT.

Cedar creek	Near Ainsworth	Prov. Water Dist. No. 7.
Hammill creek	Near Argenta	Prov. Water Dist. No. 7.
Woodbury creek	Near Ainsworth	Prov. Water Dist. No. 7.

Fort George District.

The completion of the Grand Trunk Pacific Railway has opened up a large portion of central British Columbia for settlement and development, and the requests received for run-off data in connection with proposed power development and municipal water supply, have made it necessary that work should be commenced in this district.

The shortage of funds has prevented us from thoroughly covering the entire district at this time, but stations have been established on the most important streams for which requests for data have been received.

Fort George District. List of Regular Gauging Stations.

Station Number.	Stream.	Location.
4004	Bulkley, Hazelton	Three-quarters mile from Old Hazelton, B.C.
4003	Bulkley, Hubert	At highway bridge, near Hubert, B.C.
4002	Dore	Grand Trunk Pacific Railway bridge, near McBride, B.C.
4000	Nechako, Ft. Fraser	Grand Trunk Pacific Railway bridge, near Fort Fraser townsite.
4006	Nechako, Vanderhoof	One-half mile from Vanderhoof, B.C.
4005	Skeena, Hazelton	At ferry.—Old Hazelton, B.C.

In addition to the foregoing list, stations were established on the Stoney and Nautley rivers. The station on Stoney creek, which was established to ascertain the possibility of obtaining power for the town of Vanderhoof, was discontinued, owing to a land slide diverting the bulk of the water into another drainage area. The Nautley river, on which the station was established in connection with a proposed water development, was abandoned; a test of the water showing it to be unfit for this purpose.

Fort George District. List of Miscellaneous Gauging Stations.

Stream.	Location.
Bulkley river	Smithers.
Chilako river	Millers ranch, near South Fort George.
Dome creek	Mile 145, B.C. (G.T.P. Ry.).
Fraser river	Mile 145, B.C. (G.T.P. Ry.).
Nautley river	Fort Fraser.
Stoney creek	Vanderhoof.

EXPLANATION OF TABLES.

For each regular gauging station the following data are given so far as available:—

1. Description of station.
2. Table of discharge measurements.
3. Daily gauge-height discharge table.
4. Tables of monthly discharge and run-off.

Under the description of stations is given the location, general information regarding the equipment, and the time the station has been maintained. Regarding stations established this year, is given briefly, the source, description of drainage area, and present uses of the river. In addition, the description covers ice conditions and their effect on the relation of gauge height to discharge.

The table of discharge measurements gives the number of measurements made during the year, the date measurement was made, name of engineer, the width and area of the cross section and the discharge in cubic feet per second. The zero of the gauge is set to an arbitrary datum, and has no relation to the zero flow or bed of the river. In general, the zero is located below the lowest known flow.

The daily gauge-height discharge tables give the daily elevation of the surface of the river above the zero of the gauge, and the daily discharge in cubic feet per second for the observed gauge height.

In the table of monthly discharge the column headed "Maximum" gives the mean flow for the day when the mean gauge height was highest. As the gauge height is the mean for the day, there may have been short periods when the gauge height and corresponding discharge was higher than given in this column. Likewise in the column of "Minimum" the quantity given is the mean flow for the day when the mean gauge height was lowest. The column headed "Mean" is the average flow for each second during the month. On this the computations for the remaining columns are based.

DEFINITIONS OF TERMS.

The volume of water flowing in a stream called the run-off or "discharge" is expressed in various terms, each of which has become associated with a certain class of work. These terms may be divided into two groups: (1) those which represent a rate of flow, as second-feet, gallons per minute, and run-off in second feet per square mile; and (2) those which represent the actual quantity of water, as run-off in depth in inches and acre feet.

The units used in this report are, second-feet, second-feet per square mile, run-off in inches, and acre-feet.

"Second-foot" is an abbreviation for cubic foot per second (c. f. s.) and is the rate of discharge of water flowing in a stream 1 foot wide, 1 foot deep, at a rate of 1 foot per second. It is generally used as a fundamental unit from which others are computed by the use of the factors given in the following table of equivalents.

"Second-feet per square mile" is the average number of cubic feet of water flowing per second from each square mile of area drained, assuming that the run-off is distributed uniformly both as regards time and area.

"Run-off in inches" is the depth to which the drainage area would be covered if all the water flowing from it in a given period were conserved and uniformly distributed on the surface. It is used for comparing run-off with rainfall, which is usually expressed in depth in inches.

"Acre-foot is equivalent to 43,560 cubic feet, and is the quantity required to cover an acre to the depth of 1 foot. It is a common unit of measurement of quantity, and is generally used in connection with storage.

CONVENIENT EQUIVALENTS.

The following is a list of convenient equivalents for use in hydraulic computations:—

1 second-foot equals 35.71 British Columbia miner's inches.

1 second-foot equals 6.23 British Imperial gallons per second; equals 538,472 gallons for one day.

1 second-foot equals 7.48 United States gallons per second; equals 646,272 gallons for one day.

1 second-foot for one year covers 1 square mile, 1.131 feet or 13.572 inches deep.

1 second-foot for one year equals 31,536,000 cubic feet; equals 724 acre-feet.

1 second-foot equals about 1 acre-inch per hour.

1 second-foot for one day equals 86,400 cubic feet; equals 1.983 acre-feet.

1 second-foot for one 28 day month equals 55.52 acre-feet.

1 second-foot for one 29 day month equals 57.50 acre-feet.

1 second-foot for one 30 day month equals 59.48 acre-feet.

1 second-foot for one 31 day month equals 61.46 acre-feet.

1 second-foot for one 28 day month covers 1 square mile 1.041 inches deep.

1 second-foot for one 29 day month covers 1 square mile 1.079 inches deep.

1 second-foot for one 30 day month covers 1 square mile 1.116 inches deep.

1 second-foot for one 31 day month covers 1 square mile 1.153 inches deep.

100 British Imperial gallons per minute equals 0.268 second-feet.

100 United States gallons per minute equals 0.223 second-feet.

1,000,000 British Imperial gallons per day equals 1.86 second-feet.

1,000,000 United States gallons per day equals 1.55 second-feet.

1,000,000 British Imperial gallons equals 3.68 acre-feet.

1,000,000 United States gallons equals 3.07 acre-feet.

1,000,000 cubic feet equals 22.95 acre-feet.

1 acre-foot equals 43,560 cubic feet.

1 acre-foot equals 271,472 British imperial gallons.

1 acre-foot equals 325,850 United States gallons.

1 inch deep on 1 square mile equals 2,323,200 cubic feet.

1 inch deep on 1 square mile equals 0.0737 second-foot per year.

1 acre equals 43,560 square feet.
1 cubic foot equals 6.23 British imperial gallons.
1 cubic foot equals 7.48 United States gallons.
1 cubic foot of water weighs 62.4 pounds.
1 horse-power equals 550 foot-pounds per second.
1 horse-power equals 746 watts.
1 horse-power equals 1 second-foot falling 8.80 feet.
To calculate water power quickly:

$$\frac{\text{sec.-ft. x fall in feet}}{11} = \text{net horse-power on water wheel, realizing 80 per cent}$$

of theoretical power.

ACCURACY AND RELIABILITY OF DATA.

Practically all discharge measurements made under fair conditions are well within 5 per cent of the true discharge of the time of observation. Inasmuch as the errors of meter measurements are largely compensating, the mean rating curve, when well defined, is much more accurate than the individual measurements.

In order to give information regarding the probable accuracy of the computed results, an accuracy column is inserted in the monthly discharge table. Accuracy "A" indicates that the mean accuracy is probably accurate within 5 per cent; "B" within 10 per cent; "C" within 15 per cent; "D" within 15 to 25 per cent. Special conditions are covered by foot notes.

The accuracy in many cases is not as great as we would wish, the area covered is very large, and a large number of the stations have been maintained but a short time. Future observations may render necessary a certain amount of revision of the data here supplied.

The topographic surveys of the province are very incomplete, and the drainage areas are, in many cases, only approximate; consequently the figures showing discharge per square mile, and run-off depth in inches may be somewhat in error.

PUBLICATIONS.

The stream measurement work of this organization to date has been made available to the public in the following publications:—

Water Resources Paper No. 1.—Records to Dec. 31, 1912.
Water Resources Paper No. 8.—Records to Dec. 31, 1913.
Water Resources Paper No. 14.—Records to Dec. 31, 1914.
Water Resources Paper No. 18.—Records to Dec. 31, 1915.

ACKNOWLEDGMENTS.

I take pleasure in expressing my appreciation of the hearty co-operation of the different individuals and companies interested in stream flow in the province, particularly the following:—
The Westminster Power Company; Messrs. Anderson & Warden, Civil Engineers, Vancouver, B.C.; Mr. Fellows, City Engineer, Vancouver, B.C.; Mr. F. A. Easton, C.E., Assistant Engineer, Vancouver Power Co., Ltd.; Mr. Wallace Grime, Secretary, Campbell River Power Company, Victoria, B.C.; Mr. James Hunter, C.E., Chief Engineer, Canadian Collieries (Dunsmuir) Ltd; Mr. Wm. Young, C.E., Comptroller of Water Rights, Victoria, B.C.; The Hon. L. A. Campbell; Mr. Bulger, Nakusp; and the district engineers of the Water Rights Branch, Government of British Columbia.

The following publications have been made use of in the compilation of this report:—The Monthly Weather Review, by the Meteorological Service of the Department of Marine and Fisheries and certain memoirs issued by the Geological Survey of the Department of Mines.

REPORT

OF THE

BRITISH COLUMBIA HYDROMETRIC SURVEY FOR 1915.

CHAPTER II.

REPORT OF C. E. WEBB, B.A.Sc.

ACTING DIVISION ENGINEER.

CHAPTER II.

COAST DIVISION.

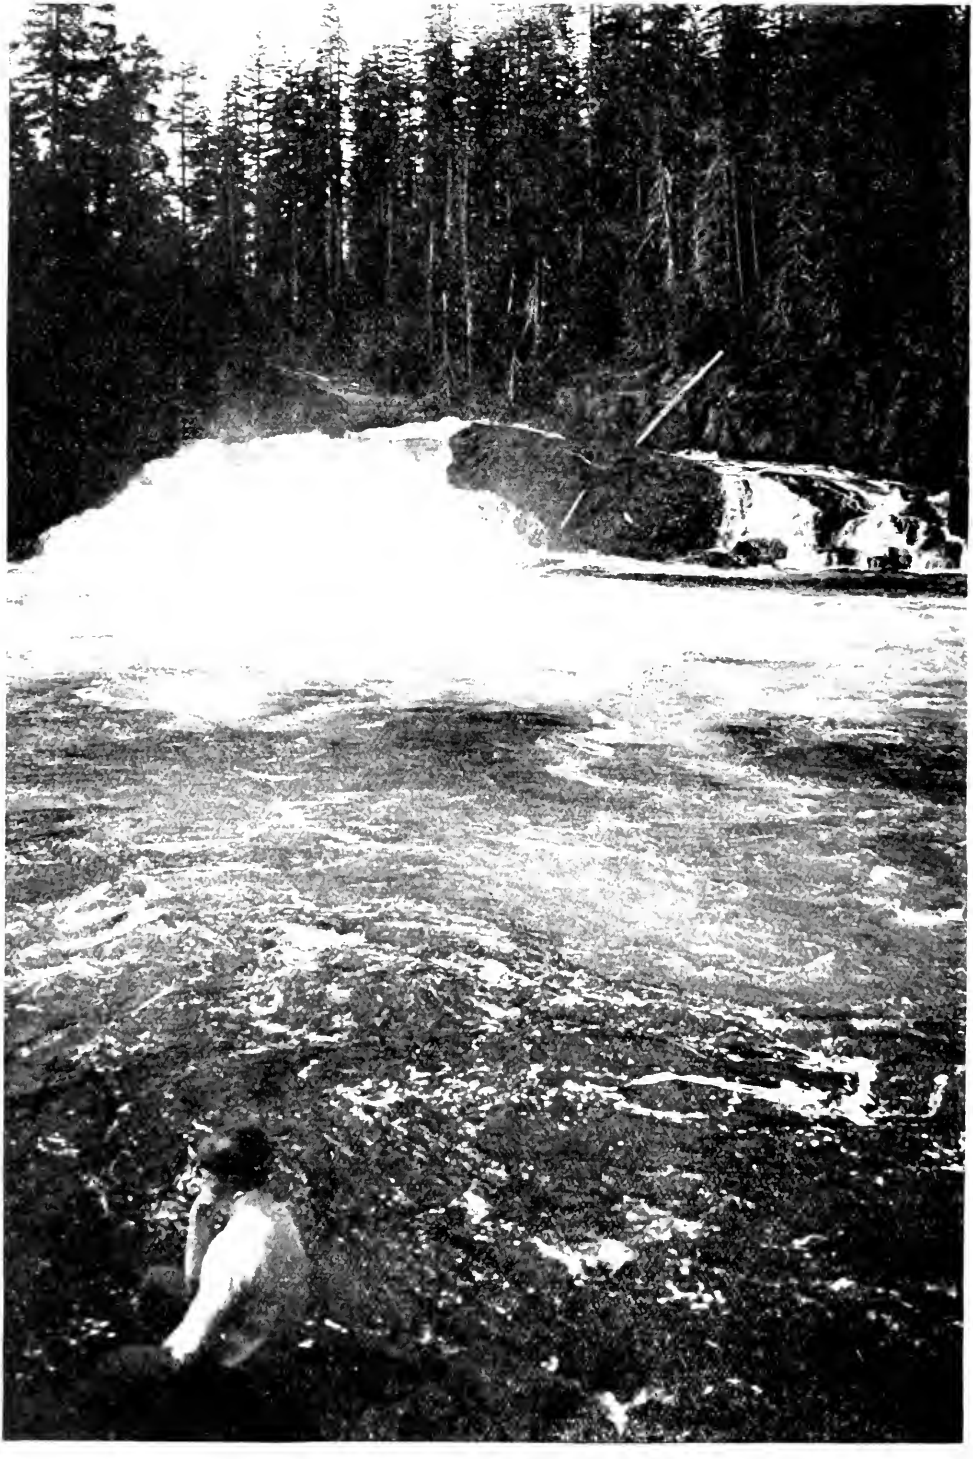
TERRITORY.

Geography.—The Coast division of the British Columbia Hydrometric Survey comprises the south-western part of British Columbia. By referring to the key map showing the number and location of all the regular gauging stations, the exact boundaries may be clearly noted. All gauging stations numbering in the *One* Thousands are in the Coast division.

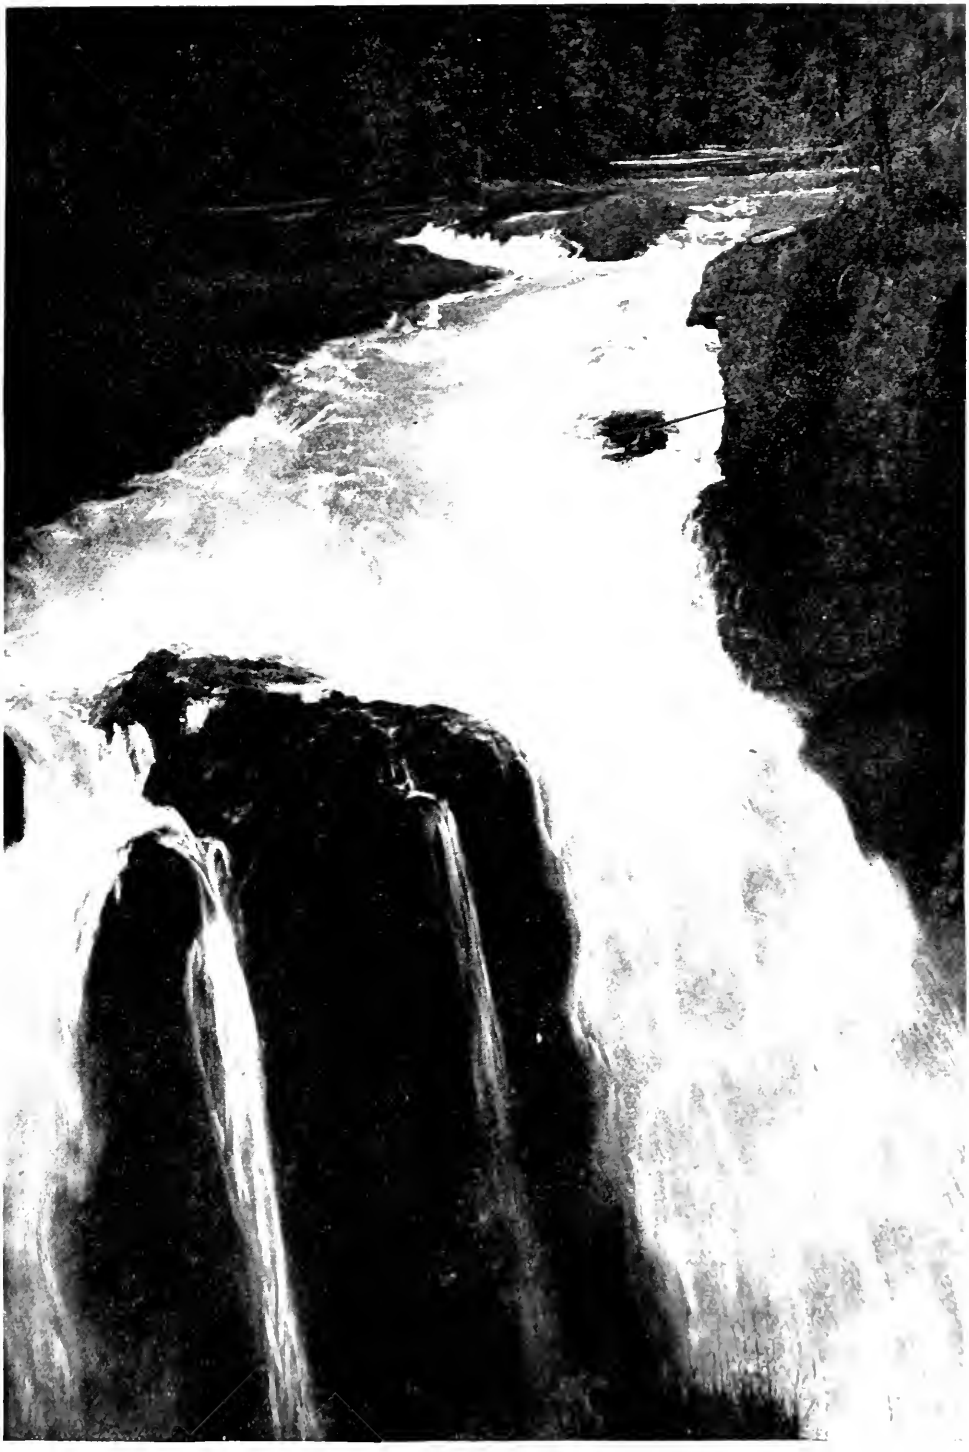
The Coast division is subdivided into three districts, known as Lillooet, Southern, and Vancouver Island. These districts were fully described in the 1914 report (Water Resources Paper No. 14.) Generally speaking, the Lillooet district extends along the line of the Pacific Great Eastern Railway from the head of Howe Sound to the vicinity of the town of Lillooet. The southern district comprises the territory around Vancouver, and extends up the valley of the Fraser river as far east as North Bend. Vancouver Island district is the whole of Vancouver Island, although as yet no work has been done on the north end or west coast.

The Coast division includes the large manufacturing centres of Greater Vancouver, New Westminster, and Victoria. These centres are supplied with electric energy by two large hydro-electric power companies, the Western Canada Power Company and the British Columbia Electric Railway Company.

Showing intake of Vancouver Water Supply.
Gauging section, Capilano creek, 10 feet above intake.



Moose falls, Campbell river.



Elk falls, Campbell river.
This is considered the best undeveloped water power on the British Columbia Coast.

Topography.—The topography of the Coast division varies to such a great extent that it is hard to discuss it with regard to the different drainages, except in a very general manner. Along the Fraser river from North Bend west, the topography changes from the high rugged mountains of the Coast range, with narrow bench lands, to the fertile low lands at the mouth of the river where the valley is wide. The great interior plateau with its semi-arid soil comes into the division in the vicinity of Lillooet. There is some fine agricultural land in this district which, when irrigated, yields excellent crops. To the west of Lillooet the mountains rise rapidly and precipitation increases. Vancouver Island has a mountainous interior and for the most part is very heavily timbered. The streams are comparatively short and swift, rising and falling rapidly with sudden changes in climatic conditions.

Economic Geology.—The mineral wealth in the division is very great and new properties are continually being opened up and developed. The present war has given a great impetus to the already active mining industry in this province and many companies are enlarging their plants, which will greatly increase their productions. Gold, silver, copper and coal are all mined extensively, while Portland cement is manufactured on a large scale on Vancouver Island.

Hydro-electric energy is used to a large extent in all mining operations in the Coast division, most mines having their own hydro-electric installations.

CLIMATE.

Temperature and Precipitation.—The climate of the south-western part of British Columbia is moderate. The warm Japan current which flows along the coast has a great effect on the climatic conditions of the province. Due to the mountainous nature of the country there is often a great difference in both temperature and precipitation in a very short distance. In the winter, precipitation is mostly caused by moisture-laden winds from the Pacific ocean. These winds frequently cross the low coastal plains without precipitating a drop of water, but on striking the cold mountain sides at a high altitude, the moisture is immediately condensed, causing heavy precipitation, probably in the form of snow on the mountains and rain in the valleys.

The snow stored in the higher altitudes during the winter comes off as a rule during May and June. The streams along the coast and on Vancouver Island are subject to high water almost any time from October to June. These streams usually have their minimum flow in the months of August and September. The inland streams in the southern and Lillooet districts being subject to lower temperatures in the winter months, generally have their minimum flow in January and February and their maximum flow in the spring.

Temperature and precipitation tables for the different localities in each district, accompanying this report, give the mean monthly temperature and the total monthly precipitation for the year, with the difference from the average in each case for the past ten years or more. These tables have been compiled from the monthly reports of the Meteorological Service of Canada, Mr. R. F. Stupart, F.R.S.C., director.

In compiling these tables an endeavor has been made to choose those observation stations that will most closely average the actual precipitations and temperatures over the whole division.

USES OF WATER.

The uses of water may more easily be discussed under the following headings: Municipal Water Supply, Irrigation, Reclamation, Water Power Developments, and Water Power Possibilities.

View of Stamp falls, on Stamp river.

In the accompanying lists the streams are classified under the different headings. Descriptions of each stream may be found either in this or a previous report. By referring to the lists, the number and year of the Water Resources paper describing each stream may be found.

MUNICIPAL SUPPLY.

The supply of pure water to municipalities, towns or cities requires the thorough investigation of the flow in available streams.

IRRIGATION.

The lands in the valley of the Fraser river, around Lillooet require irrigation. There are many small streams in this district which require to be controlled to give a regular supply of water during the dry season, which usually extends from June till September.

RECLAMATION.

The study of the high water on the Coquitlam river, in view of reclaiming the lands which are yearly flooded by the overflowing of the banks of this river, has been given considerable attention this year. Discharge data has been obtained for the year since January 25th. Other streams are listed in the report. The study of the stream flow of Lillooet river has been continued to ascertain the amount of water to be taken care of in the reclaiming of some forty square miles of good agricultural land at the head of Lillooet lake.

WATER POWER DEVELOPMENTS.

The water power developed on the streams investigated by this survey has been discussed in previous papers.

WATER POWER POSSIBILITIES.

Many inquiries are being received regarding the possibilities of the establishment of electro-chemical manufacturing plants on or near the coast. During the year very few new investigations were started on power streams in the Coast division, as funds have not been available for the extension of work. There are many economical developments available. All streams which have been examined by this survey for the economical development of hydro-electric energy have been discussed in previous reports.

The following list shows the present use and possible future uses of the water where gauging stations have been established, and indicates the reason for maintaining the station.

REPORT

OF THE

BRITISH COLUMBIA HYDROMETRIC SURVEY FOR 1915.

CHAPTER III.

Kamloops Division.

REPORT OF C. G. CLINE, B.A.Sc., D.L.S.

DIVISION ENGINEER.

CHAPTER III.

KAMLOOPS DIVISION.

TERRITORY.

Geography.—The Kamloops division consists of the southern central portion of British Columbia, and comprises the provincial land districts of Kamloops, Similkameen, Osoyoos and a small part of Yale. It includes the watershed of the Thompson river, and a portion of the Columbia River basin lying north of the International boundary and drained by the Kettle, Similkameen and Okanagan rivers. The total area is 33,000 square miles.

The division coincides approximately with what is known to geologists as the Interior Plateau region which extends from the Coast range of mountains on the west to the Gold range on the east, and has the two branches of the Cascade range to the south and south-west. Many characteristic features of the climate of this part of the province are directly traceable to these circumstances of location and surroundings.

Topography and Geology.—The region is composed of extensive plateaus, numerous valleys, great and small, and broadly rounded summits with gently sloping sides. The general elevation of the plateaus is from 4,000 to 5,000 feet above sea-level. The deeper valleys, which contain the main drainage systems of the country are at about 1,000 feet. The rounded summits rise as high as 6,000 and 7,000 feet, there is a very considerable range of altitude.

Dawson falls, Murtle river.

The deeper valleys seem to have been scoured out by ice action or eroded by water. They are broadly U-shaped and are only partly occupied by the streams which flow through them. In certain cases, however, the streams have expanded into lakes, and fill practically the whole width of the valley bottom.

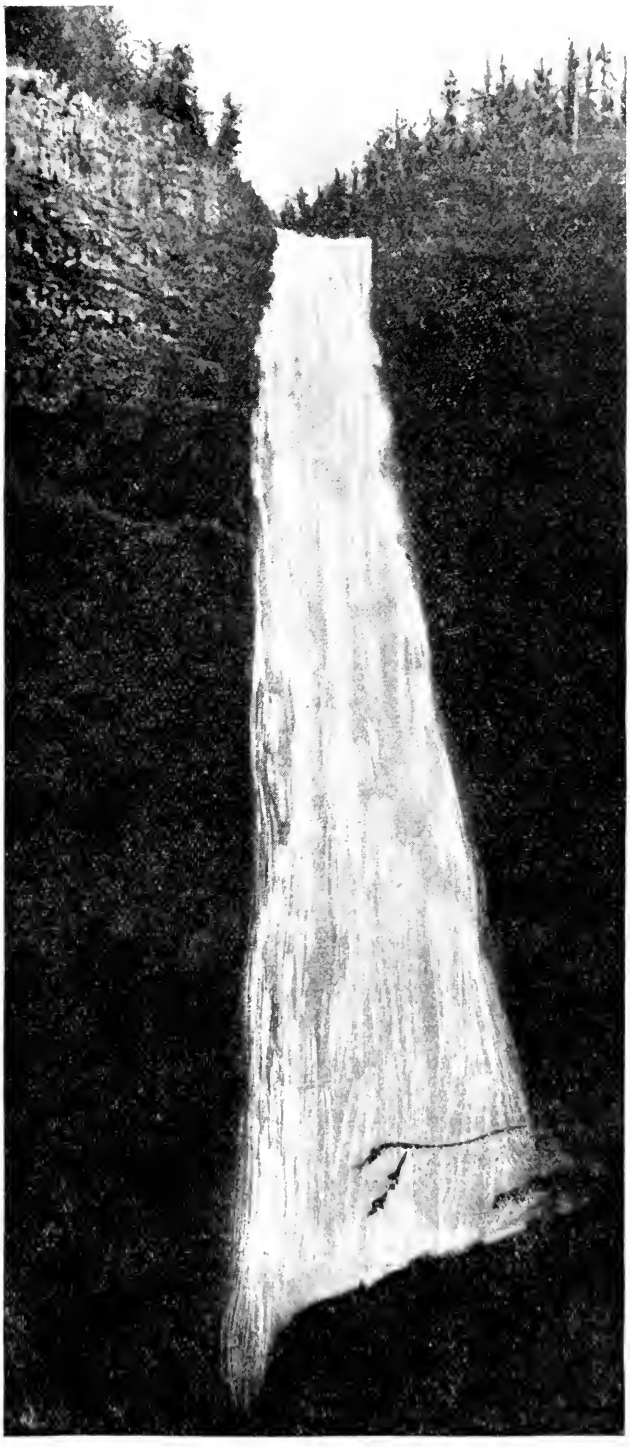
The depth of the tributary valleys and the steepness of their slope toward the main drainage system, seem to depend on the size of the streams. The valleys of the large rivers have been worn down until the slope is comparatively small, whereas the valleys of the small creeks are not nearly as deep and often descend hundreds of feet in a few miles. If a small stream which has its source on a plateau or on the side of a mountain, flows directly into one of the main drainage rivers, its descent is necessarily very rapid; if it is tributary to a stream of intermediate size, its descent is generally more gradual. As a rule, the smaller streams have the steeper slopes and are often more important for many purposes than the larger ones.

Alfalfa field beside South Thompson river, irrigated by pumping.

CLIMATE.

The Kamloops division is nearly all within the central dry belt. The winds from the Pacific ocean have been deprived of moisture on the western slope of the Coast range, and are heated as they descend to the plateau region. Winds from other directions are affected in a similar manner, so that they are generally capable of absorbing moisture. As a consequence, the climate is dry. The annual range of temperature is great, as is also the daily range in summer.

A study of the following tables will give an idea of some of the features of the climate in this part of the province. They give the precipitation and temperature for the stations of the meteorological service which are in this division. The variations from the average are also tabulated where the records extend over a period long enough to render the averages reliable.



Murtle river, at Helmcken falls. A sheer fall of 450 feet.
—Photograph by F. R. Archibald.

It is well to bear in mind that most of these stations are located in the main valleys in the centres of population, and that very few are on the plateaus and none on the mountains. The stations at Edith lake above Kamloops, and at the Nickel Plate mine above Hedley, show very clearly the difference in temperature and precipitation caused by a difference of two or three thousand feet in altitude. Both these stations have lower temperatures and greater precipitations than the ones in the valley below them though they are only a few miles away. For any considerable watershed area, the mean monthly precipitation and the mean monthly temperature may differ a good deal from the figures obtained at the centre of population of that area.

The influence of the mountain ranges is quite noticeable. Around Shuswap lake, which is just west of the Gold range, the precipitation is greatest, and it diminishes towards the south and west. There is a greater precipitation in the

Thompson river. Irrigated lands, near Ashcroft.

valley of the North Thompson river, than there is at Kamloops which has the valley of the South Thompson lying open to the east. The precipitation is fairly large in the Similkameen valley, but not nearly as large as it is on the western side of the Hope mountains. The effect of the mountains in increasing the precipitation is most noticeable on their western slopes, where the moisture-bearing winds from the west are cooled as they ascend to higher altitudes.

The tables giving the variation from the average afford a ready means of comparing the weather conditions of 1915 with those of other years. They show that the winter was much milder than usual, with a rather lighter precipitation. As a result, very little snow remained on the hills till spring and it looked as though there might be a very considerable shortage of water. In the spring and summer, however, the precipitation was considerably heavier than usual so that the irrigationists and other water users had a fairly good supply.

USES OF WATER.

The general characteristics of the streams of this division previously mentioned, have a considerable effect on the uses to which they are put. A large stream flowing with a small slope through a broad, fertile valley, provides an unfailing supply of water, but for most purposes it is at so low an elevation that it is not easily utilized. A smaller tributary stream, on the other hand, while carrying less water, will generally have such a steep slope that the water can be diverted and carried through a gravity system to the places where it is needed. In many localities, therefore, practically the whole flow of a small stream may be used and found insufficient, whereas a large stream close at hand may be used very little or not at all. In such cases an accurate measurement of the discharge of the smaller stream is more important from an irrigation viewpoint than the measurement of the larger one.

One of the outstanding features of the use of water in this division is in the matter of irrigation. The large amount of sunshine and hot weather during the summer make ideal growing conditions, particularly in the larger valleys, but the small amount of precipitation, especially during the summer months, render irrigation necessary throughout nearly the whole division. On some of the higher lands, dry farming seems to be meeting with considerable success; but it is in the broad, fertile valleys that most of the farming is carried on, and it is there that irrigation is practiced so extensively. In the past, gravity supplies from the smaller streams have been given a marked preference, and no doubt these are the best where there is sufficient water. In certain localities, however, pumping plants are being installed to raise water from the large rivers and lakes on to land which could not be otherwise irrigated. Cheap hydro-electric power is quite an important factor in this development.

The following list shows the present use or possible future uses of the water, where gauging stations have been established, and indicates the reason for maintaining the station.

REPORT

OF THE

BRITISH COLUMBIA HYDROMETRIC SURVEY FOR 1915.

CHAPTER IV.

Nelson Division.

REPORT OF C. E. RICHARDSON, B.A.Sc., D.L.S.

DIVISION ENGINEER.

CHAPTER IV.

NELSON DIVISION.

TERRITORY.

Geography.—This division covers approximately 29,000 square miles of the south and eastern part of the province of British Columbia. The division might readily be called "Kootenay division" as it extends over practically all of that area known as Kootenay district. It is bounded on the north by the height of land connecting the summit of the Rockies with the summit of the Columbia or Gold mountains; on the west by the summit of the Columbia range; on the south by the 49th parallel of latitude or International boundary, and on the east by the backbone of the Rockies. This area is very mountainous, with numerous lakes, rivers and creeks, which afford innumerable opportunites for future water power development; there are three rivers, however, that constitute the drainage system of the whole division; these are the Columbia, the Kootenay and the Pend d'Oreille.

The Columbia rises in the Columbia and Windermere lakes, 90 miles south-east of Golden and flows in a north-westerly direction for about 200 miles to the mouth of Canoe river at Big Bend, near the northerly limits of the division.

From Canoe river the Columbia flows practically south for about 250 miles, past Revelstoke, through the beautiful Arrow lakes, crossing the International boundary near Waneta, B.C. Kootenay river rises in the Beaverfoot range of the Rockies, about 35 miles south-east of Golden and flows practically south for 175 miles, passing within one mile of Columbia lake and crossing the International boundary near Newgate, B.C. It flows through Montana into Idaho, entering West Kootenay 60 miles west of Newgate and 20 miles south of Kootenay Landing, at which point the river loses itself in beautiful Kootenay lake. From the west arm of Kootenay lake the river flows in a south-westerly direction, discharging into Columbia river 20 miles north of the boundary. Pend d'Oreille river, of which Flathead river in East Kootenay is a tributary, has only a small portion of its drainage in Canada. It discharges into Columbia river about 200 yards above the International boundary.

Hot springs are numerous, several being located in the vicinity of Windermere lakes, Halcyon, Ainsworth and other points.

In the division three national parks are located—The Yoho, Glacier and Revelstoke. Each park has its outstanding features. Yoho with its Yoho valley, Takakkaw falls, natural bridge and Emerald lake; Glacier with Illecillewaet, Grand and Gegic glaciers and mammoth snowfields; Revelstoke, with its prairie country near the summit of Mt. Revelstoke.

The chief industries are mining (of coal, gold, lead, silver, copper and zinc) lumber (chiefly B.C. fir and western pine) and farming (mixed and fruit).

Transportation facilities are afforded by the main line of the C.P.R. in the north, and various branch lines of the C.P.R. and Great Northern in the south. Navigation is carried on continuously on Kootenay and Arrow lakes. Good roads are frequent in East Kootenay and government trails give access to other principal points of interest.

TOPOGRAPHY.

Mountain Systems.—The topography of Nelson division is relative to four mountain systems—the Rockies, the Purcells, the Selkirks and the Columbia range.

The summit of the Rockies, which constitutes the eastern boundary of the division, consists of a well defined range studded with snow-capped peaks, many of which are well over 10,000 feet. The western slope includes various local ranges, mostly paralleling the main range. The more famous passes are Crowsnest, Vermilion and Kicking Horse, about 5,000 feet at the divides. The larger rivers from south to north are the Elk, Bull, Kootenay, above Canal flats, Kicking Horse, Blaeberry and Bush. These streams, with the possible exception of the Bull, are all glacial fed and the valleys generally are well timbered to an elevation of 7,000 feet.

The Purcells constitute that system to the west of the Rockies bounded on the north by the confluence of Columbia and Beaver rivers, on the east by Columbia and Kootenay rivers, on the south by the Kootenay and on the west by the north-flowing portion of Kootenay river, Kootenay lake, Duncan river and Beaver rivers.

The principal streams fed by the Purcells are, Goat, Moyie, Yahk, St. Marys, Findlay, Dutch, Toby, Horsethief, Forsters (No. 2), Bugaboo, Spillimacheen, Hammil and Fry. Many of these streams are glacial fed.

The Selkirks extend southward from the Big Bend of Columbia river, lying between the Rockies and Purcells on the west and Columbia range on the east. The northern portion of the Selkirks are strikingly scenic, peaks are high and treacherous; passes are few, Rogers pass alone is well known. The more important rivers are Incomappleux, Akolkolex, Illecillewaet, Downie, Gold, and Mountain. Well known glaciers are the Illecillewaet or Great glacier, Grand glacier and Gegic glacier. One mammoth snowfield feeds these glaciers.

The summit of Columbia or Gold range forms the western boundary of this division. This system of mountains is less impressive than the three already described. The larger rivers are Inonoaklin, Whatshan, Arrowpark, Pingston, and Jordon. A few small glaciers may be found in the higher peaks.

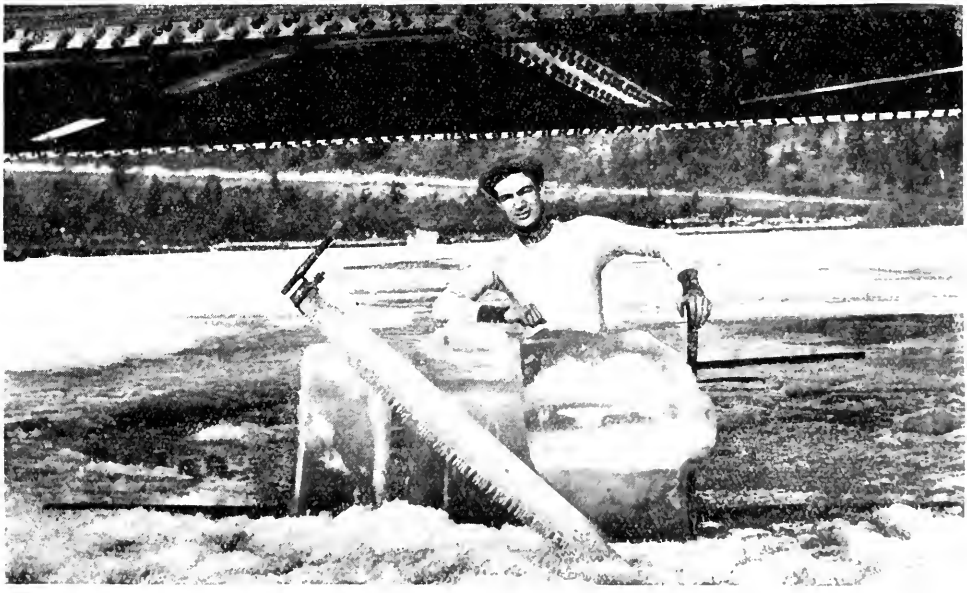
Trenches.—Between the ranges of mountains above mentioned there are these great depressions or trenches, namely, Rocky Mountain trench, Purcell trench and "Selkirk valley."

Rocky Mountain trench lies between the Rockies and the Purcells in the south and Selkirk in the north of this division. It extends in Canada from the International boundary in a north-westerly direction as far north as Alaska and perhaps to the Arctic ocean. In Nelson division it is occupied by south-

flowing Kootenay river, the north-flowing Columbia and Canoe rivers. The average width of its floor is 5 miles but in the neighborhood of St. Marys river, near Cranbrook, it is 16 miles wide and varies in width to the International boundary, affording in the plains possibilities for agriculture.

Purcell trench, approximately 200 miles in length, separates Purcell range on the east from the Selkirks on the west. It is occupied by Beaver river, Duncan river, Kootenay lake and north-flowing Kootenay river. On an average the valley is 2 to 5 miles wide.

Selkirk valley or trench is occupied by Columbia river, flowing south, and the Arrow lakes. It is from 3 to 5 miles in width and separates the Selkirks on the east from Columbia or Gold range on the west. Upper Arrow lake is about 40 miles long and from 2 to 3 miles wide. The mountains rise abruptly to an



Showing thickness of ice on Bull river.

altitude of from 5,000 to 7,000 feet. The lower lake is about 50 miles long and has an average width of 2 miles. There are pronounced falls on practically all the tributaries to the lakes.

Geology.—Mining is by far the most important industry in this division. In 1913 and 1914 approximately two-thirds of the mine production of British Columbia was from the Kootenay-Boundary district. Gold, silver, lead, copper, zinc and coal are mined in various localities, particularly in the southern part.

CLIMATE.

Run-off is relative directly to topography and climate. Climatic conditions are themselves partially dependent on topography. In the study of stream

flow it is essential to be familiar with these two factors. The topography, however, remains a constant factor and the variation in the flow of streams is due therefore directly to climatic conditions. In this division the peculiar topography affords a remarkable climate. It is impossible to assume that the climatic conditions at a certain point will be general in that neighborhood. On the other hand although there are marked variations in some sections a general resemblance may be seen between other localities.

The following tables are appended:—

1. Monthly and yearly precipitation, 1915.
2. Differences from average precipitation.
3. Mean monthly and average temperatures, 1915.
4. Differences from average temperature.

These tables are compiled from the monthly reports for 1915 of the Meteorological Service, Mr. R. F. Stupart, director.

In these tables a comparison is shown between 10 points, 5 in East Kootenay and 5 in West Kootenay. With the exception of Glacier and Fernie these points are all in the valleys of Columbia and Kootenay rivers—practically the lowest points in their respective localities. It must be remembered that the precipitation or temperature at any one of these points does not represent the precipitation or temperature in its locality.

USES OF WATER.

MUNICIPAL SUPPLY.

In the Kootenays the mountain streams, lakes and springs generally afford an ample supply for municipal purposes without much difficulty being encountered. It is essential, however, in many cases, that a study of the streams be made. The variation of the flow is so great that unless those interested are familiar with the streams, they will be deceived by appearances. Studies are now being carried on by this survey with regard to municipal supply and when possible any assistance will gladly be given interested parties.

IRRIGATION.

The scarcity of agricultural land and the richness of the soil necessitates the utilization of all available land in an attempt to fulfil the demands of the local markets. With the exception of small plots here and there, the valleys of Columbia and Kootenay rivers afford the only location of agricultural lands. The largest farming district is in the Rocky mountain trench (see description under topography) from Spillimacheen south to the International boundary.

Irrigation is practised to some extent in the valleys throughout the whole division. It is essential in East Kootenay, south of Spillimacheen. In the vicinity of Edgewater and Athalmer two companies, holding large tracts of land, installed irrigation systems, which include over 30 miles of flume.

At present systematic records during the irrigation season are being obtained on approximately 15 irrigation streams.

MINING.

In the operation of practically all mines the use of water is essential. After the ore is mined and shipped to the smelter, water and water power become an important factor.

Various requests have come in during the year for information on small streams for mining purposes. Where possible information is supplied, but these streams are so numerous that it is hard to tell upon which information will be required.

RECLAMATION.

There are two large reclamation projects in this division—on the Columbia between Golden and Spillimacheen, and on the Kootenay above Kootenay lake. The former is at present under way, surveys have been made and plans submitted. This scheme deals with the reclamation of about 15,000 acres. The Kootenay flats reclamation is an international affair, including probably more land in the United States than in British Columbia. The required surveys, etc., have not as yet been made.

Systematic and reliable stream flow data is being obtained in connection with these projects on the Columbia, near Golden and Kootenay river, at the outlet of the lake, near Nelson.

WATER POWER DEVELOPMENT.

A rather complete list of water power developments was published in the report of the division engineer, Kootenay Boundary division, in Water Resources Paper No. 8. These powers were listed under "Mining" and under "Hydro-electric Developments." Since that list was published no large plants have been installed. Various small powers of from 100 to 500 H.P. have since been utilized for mining purposes and improvements and additions have been made to some of the larger plants. The West Kootenay Light and Power Co. have remodelled their plant at lower Bonnington Falls to accommodate the demand for power of the new zinc smelter at Trail. The City of Revelstoke have re-modelled their municipal plant and installed a new turbine and generator, which greatly increases the efficiency of the plant.

Power is used extensively for mining. Of the total installation, probably in excess of 40,000 horse power, over 30,000 horse power is used for mining and smelting. Installations in this division are comparatively cheap, due to the pronounced falls and canyons on most of the streams.

WATER POWER POSSIBILITIES.

Water Power possibilities throughout the Kootenay are innumerable and dozens of unnoticed sites would be in demand were they located in other parts of the Dominion. The topographic conditions afford in most cases a high head at considerably less than the average cost for Canada. The combination of the climatic and topographic conditions on the other hand is often a detriment. The variation in flow is extreme, a heavy freshet generally occurring in May, June or July, and very low water with frazil ice occurring in February and March,

A careful study of the characteristics of each individual stream is essential before any plant is installed. The streams throughout this division are most deceptive and it is not safe to estimate the run off of any one stream from a study of its next door neighbor.

The following list shows the present use and possible future uses of the water where gauging stations have been established, and indicates the reason for maintaining the station.

MUNICIPAL WATER SUPPLY.

Revelstoke District.

REPORT

OF THE

BRITISH COLUMBIA HYDROMETRIC SURVEY FOR 1915.

CHAPTER V.

Fort George District.

REPORT OF J. A. ELLIOTT, B.A.Sc.

DISTRICT ENGINEER.

CHAPTER V.

FORT GEORGE DISTRICT.

TERRITORY.

Geography.—The completion of the Grand Trunk Pacific Railway opens up a large portion of central British Columbia for settlement and development. This railway enters British Columbia through the Yellowhead pass at about latitude 53°, and traversing the province in a north-westerly direction it crosses the 55th parallel near Hazelton, there turning south-west it reaches the Pacific coast at Prince Rupert, near latitude 54°.

The Fort George district covers the territory adjacent to the Grand Trunk Pacific Railway, between the Rocky mountains and the coast. The district is divided by the Great Interior plateau into two main drainage basins—the Fraser and the Skeena.

The Fraser river rises near the summit of the Yellowhead pass at an altitude of 3,710 feet. Flowing due west it falls 1,300 feet in 52 miles; near Tete Jaune it turns north-west and flows through the "Inter-montane" valley to about latitude 54°; at Fort George it receives the waters of the Nechako river and then turns westward and southward. Near Fort George it is at an altitude of 1,900 feet—a descent of 500 feet in about 200 miles.

The Nechako, the largest northern affluent of the Fraser, is 255 miles long. It rises on the eastern slope of the Interior plateau and drains several large lakes, including Ootsabunkut, 40 miles long, Cheslatta, 25, Francais, 60, and Fraser, 12 miles. About 50 miles from its confluence with the Fraser, the Nechako receives the waters of its northern tributary, Stuart river, which is 220 miles long and drains two large lakes,—Stuart lake with an area of 221 square miles and Tacla, 135 square miles.

The Skeena basin drains all the land west of the Great plateau. The Skeena river rises on the eastern slope of the Coast range at about latitude 57° and flows almost directly south for about 175 miles; near Hazelton it turns south-west and flows through the Coast range for 154 miles to the Pacific ocean, being the first river north of the Fraser to cut across this range of mountains. About 35 miles north of Hazelton the Babine river flows into the Skeena. The Babine rises in Babine lake, which has an area of 306 square miles. It drains the north-eastern slope of the Babine range. At Hazelton the Skeena receives the waters of the Bulkley river. This river rises near the summit of the Great plateau and flows in a north-westerly direction to its confluence with the Skeena.

Topography.—The upper Fraser river flowing west from Yellowhead Pass lies in an "Inter-montane" valley between the Selwyn range and the Rainbow mountains, a part of the great Rocky Mountain system. The Rainbow mountains are composed of a group of high snow-capped peaks, notable among which are,—Mount Mowat (9,293 feet), Mount Kain (9,392 feet), Mount Resplendent (11,178 feet), Lynx Mountain (10,471), Mount Helmet (11,160 feet) and Mount Robson (13,700 feet), the highest peak and greatest mass in the Canadian Rockies.

The most prominent peaks in the Selwyn group are Mount Geikie (11,016 feet) and Mount Fitzwilliam (9,747 feet).

Chain gauge and measuring section, on Skeena, at Hazelton. Measurements are made from the Indian dugout canoe shown in the foreground, points of observation being marked by a tag line.

Fifteen-foot falls, on Fraser river, near Albreda.

It is from the snowfields and glaciers of the Rainbow mountains that the upper Fraser river receives its great volume of water. Moose river, a tributary,

flowing from the eastern slopes of Resplendent, Kain and Lynx mountains has a fall of about 150 feet in Rainbow canyon, near its mouth. To the west and north of Mount Robson lies the valley of the Grand Fork of the Fraser river, part of which is known as the "Valley of a Thousand Falls," where the famous Emperor falls are located.

West of the Rainbow mountains the "Inter-montane" valley becomes a little wider and the flanking mountains less massive and predominant; on the north it is still bounded by the Rocky mountains, but the south by the lower and less massive Cariboo range, which is separated from the Selwyn range by McLellan river, flowing north to the Fraser, and Canoe river, flowing south to the Columbia. The streams rising in the Caribou range are not of great length or fall.

Near Fort George, the Fraser, turning southward, flows between the Cariboo range on the east and the Telegraph range on the west. The Telegraph range is not very prominent, being the height of land of the Great Interior plateau, dividing the watersheds of Nechako and Chilcotin rivers.

The Nechako river, flowing into the Fraser at Fort George, drains a great basin, which is said by geologists to be an old lake bed. This basin now contains many large lakes. On the south-west it is bounded by the lower Telegraph and Fawnie ranges and the heights of the Interior plateau; to the west lies the Coast range, and on the north and east the upper Nechako valley is confined by the Omineca mountains and the ridge between the Parsnip and Stuart valleys. Throughout the Nechako district there are no very great differences in elevation.

The Bulkley valley is more undulating and varies from four to ten miles in width. On the north-east it is bounded by the Babine mountains and on the south-west by the Hudson bay and massive Rochers DeBoules mountains. The streams rising in the Rochers DeBoules mountains are short in length but contain many falls and rapids.

The upper Skeena valley lies between the Coast and Cassiar ranges. The Cassiar range at the south being terminated by the Babine river valley. Westward from Hazelton the Skeena valley cuts the Coast range transversely. The bounding mountains are high and clearly outlined, the valley is narrow and deep. Many of the streams of this district have considerable fall and pass through canyons in the deep valleys.

The relative elevations of points in the Skeena and Fraser drainage basins may be well shown by the following altitudes at points along the Grand Trunk Pacific Railway:—

		Feet
Skeena	Terrace	240
	Hazelton	985
Bulkley	Moricetown	1353
	Hubert	1690
	Houston	1952
Height of land near Rose lake		2366
Nechako	Fraser lake	2,208
	Vanderhoof	2,097
	Stuart river	2,087
	Fort George	1,870
Fraser	Willow river	1,924
	McBride	2,370
	Tete Jaune	2,400
	Lucerne	3,619

Geology.—There is little known at present of the geological formation of the district, very little mapping having been done. The mineral deposits in many parts of the district are known to be very rich. On the east, in the Rocky mountains and Cariboo range, copper and gold are found in several places, though no extensive mining has yet been carried on. Placer gold may be found in nearly all the streams of the Cariboo range. Mica is found in large quantities near Tete Jaune cache, and marble near McBride.

Several large discoveries of metalliferous veins have been found in the Bulkley and Skeena valleys and are especially predominant in the Hudson bay, Rochers DeBoules and Babine mountains. Silver-lead and chalcopyrite are the principal valuable minerals present. Zinc-blende, pyrite, arseno-pyrite and stibnite are also associated in this formation. Very little development has yet been done on any of the properties. However, owing to the impetus given to the metal market by the present war, development work is now being prosecuted on many properties in preparation for shipping. The Rochers DeBoules Copper Company have opened up a large mine near Hazelton and are now shipping large quantities of ore to the smelters. The Silver-Standard, near Hazelton, and the Cordillera Copper Mine, near Usk, have done considerable development and have recently entered the shipping lists.

Thin streaks of bituminous coal are found in considerable areas in the Bulkley and Telkwa river valleys.

CLIMATE.

The warm Japan current, flowing south along the coast of British Columbia, has a moderating influence on the climate of the central interior of the province. Warm winds penetrate the deep inlets and following the low passes at their heads spread over the Great Central plateau.

Very little meteorological data is obtainable, as yet, in this district. The only point at which rainfall and snowfall observations have been observed for any length of time is at Fort St. James, on Stuart river. The Dominion Meteorological Bureau recently established observation stations at New Hazelton, Fort St. James, and Central Fort George. Tables showing precipitation and temperature at these stations are appended hereto.

USES OF WATER.

The settlement along the greater part of the Grand Trunk Pacific being very recent, there has as yet been little commercial or industrial development of the water resources. The chief industries in this district are farming, mining and lumbering. Many small towns have been established along the railway at the central points of the various districts.

MUNICIPAL SUPPLY.

At present most of these towns are of such recent growth that no plants for distribution of water have been constructed, however this is a question of vital importance to every community and in several cases investigations are being made to determine the best source of municipal supply.

IRRIGATION.

Farming will no doubt be the chief industry of this part of the province. In many parts of the district, land is rapidly being taken up by settlers. Agricultural development of every kind is being prosecuted. Irrigation is practically unnecessary throughout the district, but where desired, an adequate supply may always be obtained from any of the numerous small streams.

WATER POWER DEVELOPMENTS AND POSSIBILITIES.

The power possibilities of this district are as yet unknown. At the present time there are only two hydro-electric plants in the district.

Woodworth Lake.

The city of Prince Rupert has installed a 1650 horse-power hydro-electric plant at Woodworth lake to generate light and power for the municipality. Water is diverted from the lake through a 45-inch pipe line 7,800 feet long, and operates under a head of 330 feet. The pipe line is also used as a means of auxiliary supply to the municipal water system.

Juniper Creek.

The Rochers DeBoules Copper Company have installed a small hydro-electric plant on Juniper creek, near Hazelton, in connection with the development of their mines. Water is carried from Juniper creek through a wood stave pipe 3,783 feet long and is delivered to a Pelton-Doble wheel under an effective head of 178 feet.

A splendid example of the latent power of the district is given by the Bulkley river, which flows in a deep, narrow canyon for 30 miles from its mouth and falls 1,000 feet in this distance.

REPORT

OF THE

BRITISH COLUMBIA HYDROMETRIC SURVEY FOR 1915.

CHAPTER VI.

Coast Division.

HYDROMETRIC DATA.

CHAPTER VI.

COAST DIVISION—HYDROMETRIC DATA.

SOUTHERN DISTRICT.

Belknap Creek at Belknap Lake.—(1000).

Location.—At the outlet of Belknap lake, in section 36, township 6, range 7, west of 7th meridian.

Records Available.—Daily discharges from October, 1912, to December, 1915. (Records for 1915 are given herein; preceding records are tabulated in previous reports).

Drainage Area.—Not determined.

Gauge.—Vertical staff gauge read bi-weekly by Mr. J. L. Davis.

Channel.—Bed of stream strewn with boulders, giving uneven bottom but permanent control.

Discharge Measurements.—Eleven meter measurements made during 1912-13-14-15, define rating curve very well except for extreme high water.

Winter Flow.—Very heavy snowfall but little ice. Open water conditions practically all winter.

Accuracy.—"D." (Poor, because gauge readings were infrequent).

Co-operation.—Gauge readings are made by employees of Westminster Power Company.

Discharge Measurements of Belknap River at Belknap Lake for 1915.

Date.	Engineer.	Meter No.	Width.	Area of Section.	Mean Velocity.	Gauge Height.	Discharge.
			Feet.	Sq. ft.	Ft. per sec.	Feet.	Sec.-ft.

The year	610	9	95			

Belknap Creek below Ann Lake.—(1063).

Location.—About half way between Ann lake and Belknap lake, near the proposed site for the diversion dam, and in section 36, township 7, range 7, west of 7th meridian.

Records Available.—Daily discharges from June, 1913, to December, 1915. (Records for 1915 are given herein; preceding records are tabulated in previous reports).

Drainage Area.—Not determined.

Gauge.—Vertical staff gauge read bi-weekly by Mr. J. L. Davis.

Channel.—Boulders and gravel.

Discharge Measurements.—Eight discharge measurements made during 1913-14-15 define the rating curve accurately except for extreme high stages.

Winter Flow.—Ice conditions at gauging station in very cold weather.

Accuracy.—"D." Poor because of infrequent gauge readings.

Co-operation.—Gauge readings are made by the employees of the Westminster Power Company.

Boulder Creek.—(1001).

Location.—Near mouth of creek, and near Jones lake, in section 28, township 3, range 27, west of 6th meridian.

Records Available.—Daily discharges from January, 1913, to December, 1915. (Records for 1915 are given herein; preceding records are tabulated in previous reports).

Drainage Area.—Not determined.

Gauge.—A fine wire is stretched tightly across the stream and the distance to the water surface is measured by a graduated rod. The result subtracted from 15.00 gives the direct reading. Daily gauge readings by Mr. R. Barr.

Channel.—The channel is about 30 feet wide. The bed of the stream is covered with boulders, giving uneven bottom but good control.

Discharge Measurements.—Six discharge measurements made during 1911-12-13-14, define the curve very well except for extreme high stages of the water.

Winter Flow.—The stream is affected by ice for about a month each winter.

Accuracy.—Below 100 cubic feet per second, "B." Above 100 cubic feet per second, "C."

Co-operation.—The records on this stream are kept by Messrs. Anderson & Warden, Civil Engineers, Vancouver, for the Vancouver Power Company.

Brandt Creek above Young Creek.—(1021).

Location.—A few hundred feet above the mouth of Young creek, in section 10, township 7, range 7, west of 7th meridian.

Records Available.—Daily discharges from November, 1914, to December, 1915. (Records for 1915 are given herein; preceding records are tabulated in previous reports).

Drainage Area.—Not determined.

Gauge.—Cable gauge. Gauge read bi-weekly by Mr. J. L. Davis.

Channel.—Solid rock at control. The channel is about 15 feet wide.

Discharge Measurements.—Five meter measurements made during 1914 and 1915 define the curve fairly well except for extreme stages of the water.

Winter Flow.—Very heavy snowfall but practically no ice, so that open water conditions prevail practically all winter.

Accuracy.—"D," because of infrequent gauge readings.

Co-operation.—Gauge readings are maintained by the Westminster Power Company.

Capilano Creek.—(1023).

Location.—Just above the Vancouver intake, about 6 miles from the mouth of the creek.

Records Available.—Daily discharges from November, 1913, to December, 1915. (Records for 1915 are given herein; preceding records are tabulated in previous reports).

Drainage Area.—Sixty-four square miles, estimated by the engineers of the Provincial Water Rights Branch.

Gauge.—Vertical gauge staff above intake. Daily gauge readings by Mr. Wm. Morrison, the caretaker of the city intake.

Channel.—Rocky bed, water swift in high stages. At low water a temporary dam is placed in the channel below the gauge, causing backwater. A subsidiary gauge has been installed for low water stages beyond the effect of this dam.

Discharge Measurements.—Fifteen discharge measurements taken in 1914 and 1915 give a well defined rating curve.

Winter Flow.—Open water all year.

Accuracy.—"C." A change in gauge was made in June, which will increase future accuracy.

Co-operation.—Gauge readings by employees of the Vancouver Waterworks department.

Discharge Measurements of Capilano Creek above City Intake for 1915.

Chehalis River.—(1003).

Location.—One and a half mile from mouth, in section 14, township 4, range 30, west of 6th meridian.

Records Available.—Daily discharges from March, 1912, to June 6, 1915. On this date the station was discontinued temporarily owing to the improbability of power development for a considerable time. (Records available for 1915 are given herein; preceding records are tabulated in previous reports.)

Drainage Area.—Two hundred square miles.

Gauge.—Chain gauge. Daily gauge readings by Mr. H. Bahn, of Harrison Mills, B.C.

Channel.—Rock bed. The water is very swift at high stages and is not confined.

Discharge Measurements.—Eleven discharge measurements taken during 1912-13-14-15 give a well defined rating curve.

Winter Flow.—Open water all year.

Accuracy.—Below 3,000 cubic feet per second "B," above 3,000 cubic feet per second, "C."

Discharge Measurements of Chehalis River 1 Mile above Mouth for 1915.

Date.	Engineer.	Meter No.	Width.	Area of Section.	Mean Velocity.	Gauge Height.	Discharge.

The period	6,700	470	1,210	6.05	34.02	362,700

Note.—Station discontinued May 31st, 1915.

Chilliwack River.—(1004).

Location.—Five miles from Sumas lake, in section 1, township 23, east of the coast meridian.

Records Available.—Daily discharges from November, 1911, to December, 1915. (Records available for 1915 are given herein; preceding records are tabulated in previous reports).

Drainage Area.—Four hundred and fifty square miles, of which about 100 square miles are in the state of Washington.

Gauge.—Vertical staff on rock-filled crib. Daily gauge readings by Mr. A. N. Smith, of Vedder Crossing, B.C.

Channel.—Rocky bottom, good control, water deep; swift at high stages.

Discharge Measurements.—Sixteen meter measurements made during 1911-12-13-14-15, give a well defined rating curve.

Winter Flow.—Open water conditions all year.

Accuracy.—"A."

Coquihalla River.—(1005).

Location.—One mile from mouth, near Hope, in section 10, township 5, range 26, west of 6th meridian.

Records Available.—Daily discharges from November, 1911, to December, 1915. (Records for 1915 are given herein; preceding records are tabulated in previous reports).

Drainage Area.—Three hundred and sixty square miles.

Gauge.—Cable gauge on highway bridge, also subsidiary cable gauge on C.N.R. trestle. The gauge reader is Mr. T. L. Thacker. The gauge on the C.N.R. trestle is read four or five times a week. The gauge on the highway bridge is read once or twice a week.

Channel.—Stream rather shallow, with rocky bottom; water swift at the higher stages.

Discharge Measurements.—Nineteen meter measurements were made during 1912-13-14-15, giving a well defined rating curve.

Winter Flow.—The section is affected by anchor ice at the riffle, although the stream never freezes over.

Accuracy.—"C." Gauge readings irregular.

Discharge Measurements of Coquihalla River at Mouth for 1915.

Coquitlam River (1066).

Location.—One mile above mouth, in section 2, township 39, west of the coast meridian.

Records Available.—Daily discharges from January 25, 1915, to December, 1915.

Drainage Area.—One hundred and fifteen square miles above metering section. Taken from provincial map 1913—(scale—3 miles to the inch).

Gauge.—Chain gauge on highway bridge at Westminster Junction. The gauge is read daily by Mr. C. Galor.

Channel.—Gravelly bottom, good control, water dead at low stages.

Discharge Measurements.—Five discharge measurements taken in 1915 give a well defined rating curve.

Winter Flow.—The stream is affected by ice only in very cold weather, which occurs but seldom.

Accuracy.—"B."

Coquitlam River.—(1066).

Coquitlam river rises in Disappointment lake and flows in a southerly direction through Coquitlam lake, discharging into the Fraser river about three miles above New Westminster. The chief tributary is Gold creek, which enters about one and a half mile from the outlet of Coquitlam lake. The total drainage area is about one hundred and fifteen square miles.

A large part of the flow of Coquitlam river is diverted through a tunnel into lake Buntzen and from there carried down in penstocks to a power house situated on the north arm of Burrard Inlet, operated by the British Columbia Electric Railway Company.

The station is established at the highway bridge in the town of Port Coquitlam. The purpose of this station is to determine the maximum flow in the channel near Port Coquitlam. The river at this point overflows its banks during the freshets, and, apart from being a constant menace to public safety, renders a large tract of land practically useless. It is altogether probable that eventually this land will be reclaimed by controlling the flow of the stream.

Daily Gauge Height and Discharge of Coquitlam River at Westminster Jct. for 1915.

December	6,740	80	1,550	13.50	15.60	95,300
The period	8,800	40	534	4.65	58.10	355,960

Note.—Station established in January, 1915.

Flume Creek.—(1062).

Location.—Five miles from Wigwam Inn, Indian river; and near the mouth of the stream.

Records Available.—Daily discharges from July, 1915, to December, 1915.

Drainage Area.—Not determined.

Gauge.—Vertical staff gauge. The gauge reader is Mr. J. L. Davis. Gauge readings are taken twice a week.

Channel.—Solid rock, good control.

Discharge Measurements.—Three discharge measurements were taken in 1915, giving a fairly well defined rating curve.

Winter Flow.—Fairly heavy snowfall, practically open conditions all winter.

Accuracy.—"D," because of infrequent gauge readings.

Co-operation.—Gauge readings are taken by the employees of the Westminster Power Company.

Flume Creek.—(1062).

Flume creek rises in the mountains to the west of the Mesliloet river and discharges into the Mesliloet river at an elevation of about 250 feet.

The annual precipitation in the Flume creek watershed is probably between 120 and 150 inches. In the higher altitudes there are snow fields which remain practically all the year.

With a fairly mild temperature in the lower altitudes, the stream is seldom frozen over and is seldom affected by ice for more than a few weeks during the coldest part of the winter.

The drainage basin of Flume creek is very rough and precipitous. The stream having a very rapid fall, a small quantity of power could be developed very cheaply. The watershed is heavily timbered with fir and cedar. During 1912 and 1913, the stream was used by the Hastings Shingle Company to provide water for a shingle bolt flume.

A metering station was established at the mouth by this survey in July, 1915 at the request of the Westminster Power Company.

Discharge Measurements of Flume Creek at Mouth for 1915.

Date.	Engineer.	Meter No.	Width	Area of Section.	Mean Velocity.	Gauge Height.	Discharge.
			Feet.	Sq. ft.	Ft. per sec.	Feet.	Sec.-ft.
May 5	C. E. Dobbie	1,057	24	36.0	2.00	2.10	72.0
July 17	R. V. Gordon	1,505	25	20.5	0.88	0.60	18.0
July 26	R. V. Gordon	1,505	5	3.3	0.95	0.00	3.1

Note.—The metering section varies with the stage of the water.

September	3	0	2			
October	188	5	80			
November	88	17	49			
December	168	17	74			
The period	188	0	36			

Note.—Station established May, 1915.

Fraser River at Hope.—(1007).

Location.—At Hope, in section 16, township 5, range 26, west of 6th meridian.

Records Available.—Daily discharges from March, 1912, to December, 1915. (Records for 1915 are given herein; preceding records are tabulated in previous reports).

Drainage Area.—Above gauging station 85,600 square miles; above mouth 90,000 square miles.

Gauge.—Painted on rock bluff at Kettle Valley Railway bridge; readings daily. Daily gauge readings by Mr. F. Nicholson, of Hope, B.C.

Channel.—About 900 feet wide, permanent, swift at higher stages.

Discharge Measurements.—Eleven meter measurements made during 1912-13-14-15, give a well defined rating curve. Some of these measurements were made by using floats.

Winter Flow.—Not enough ice to affect the gauge height-discharge relations.

Accuracy.—"B."

Co-operation.—Gauge readings taken by the engineers of the Kettle Valley Railroad.

Discharge Measurements of Fraser River at Hope for 1915.

Hixon Creek above Belknap Creek.—(1064).

Location.—About 1 mile above the mouth of Belknap creek, in section 36, township 6, range 7, west of the 7th meridian.

Records Available.—Daily discharges from April to September, 1914, and from May to December, 1915. (Records for 1915 are given herein, for 1914 records see previous report.)

Drainage Area.—Not determined.

Gauge.—Vertical staff, nailed to tree. Gauge readings are taken twice a week by Mr. J. L. Davis.

Channel.—Rock and gravel with natural log weir as control.

Discharge Measurements.—Seven discharge measurements taken during 1913-14-15, give a well defined rating curve.

Winter Flow.—Very heavy snowfall, and some ice in winter.

Accuracy.—"D," because of infrequency of gauge readings (about twice a week).

Co-operation.—Gauge readings taken by the employees of the Westminster Power Company.

Discharge Measurements of Hixon Creek above Belknap for 1915.

NOTE.—This station re-established in July.

Jones Creek.—(1010).

Location.—At outlet of Jones lake, in section 28, township 3, range 27, west of the 6th meridian.

Records Available.—Daily discharges from April, 1911, to December, 1915. (Records for 1915 are given herein; preceding records are given in previous reports).

Drainage Area.—Twenty five square miles, determined by triangulation survey by Anderson & Warden, civil engineers, Vancouver, B.C.

Gauge.—Vertical staff fastened to rock-filled crib. Daily gauge readings by Mr. R. Barr, of Ruby Creek, B.C.

Channel.—Uniform section, deep water, good control.

Discharge Measurements.—Six discharge measurements made during 1911-12-13-14-15, give a well defined rating curve.

Winter Flow.—Open water practically all winter.

Accuracy.—"A."

Co-operation.—The records of this stream are kept by Anderson & Warden, civil engineers for the Vancouver Power Company.

Lynn Creek.—(1046).

Location.—Below the overflow from the North Vancouver intake, and about 4 miles from the mouth of the stream.

Records Available.—Daily discharges from June, 1914, to December, 1915. (Records for 1915 are given herein; for 1914 records see previous report.)

Drainage Area.—Fourteen square miles, estimated by the engineers of the Provincial Water Rights Branch.

Gauge.—Cable gauge on flume bridge. Gauge read twice daily by Mr. J. Kirkland, caretaker of the North Vancouver intake.

Channel.—Boulders and solid rock.

Discharge Measurements.—Five measurements made during 1915 give a well defined rating curve.

Winter Flow.—Open water all year.

Accuracy.—"C."

Co-operation.—Gauge readings taken by the employees of the waterworks department of North Vancouver.

Discharge Measurements of Lynn Creek below Intake for 1915.

Mesliloet River.—(1011).

Location.—A short distance below canyon, 8 miles above mouth of river and in section 8, township 7, range 7, west of the 7th meridian.

Records Available.—Daily discharges from October, 1912, to December, 1915. (Records for 1915 are given herein; preceding records are tabulated in previous reports).

Drainage Area.—Estimated at 65 square miles.

Gauge.—Vertical staff bolted to rock. Gauge readings taken twice a week by Mr. J. L. Davis.

Channel.—Boulders and gravel, permanent control.

Discharge Measurements.—Fifteen discharge measurements taken during 1912-13-14-15, give a well defined rating curve.

Winter Flow.—Open water conditions all winter.

Accuracy.—"C," because of infrequent gauge readings (twice a week).

Co-operation.—Gauge readings are maintained by the Westminster Power Company.

Nicolum River.—(1058).

Location.—At the pack trail bridge, 9 miles from Hope and 4 miles from the mouth of the river, in section 27, township 4, range 5, west of 6th meridian.

Records Available.—Daily discharges from August, 1914, to December, 1915. (Records for 1915 are given herein, those preceding are tabulated in a previous report).

Drainage Area.—Thirty square miles, above gauging station.

Gauge.—Vertical staff gauge. Readings irregular. Gauge readers are Mr. W. H. Robinson and Mr. W. N. Thacker.

Channel.—Rocky, water swift at high stages.

Discharge Measurements.—Seven meter measurements taken during 1914-15, giving a well defined rating curve.

Winter Flow.—The gauge height-discharge relation is affected by anchor ice in very cold weather.

Accuracy.—"D." The accuracy is low because of very infrequent gauge readings.

Discharge Measurements of Nicolum River 4 Miles above Mouth for 1915.

October	168	20	66.9	2.23	2.57	4,110
The period	168	15	47.7	1.59	18.08	28,820

Note.—Gauge readings too infrequent during November and December to give discharge data.

Norton Creek.—(1013).

Location.—At the outlet of Norton lake, in section 10, township 7, range 7, west of the 7th meridian.

Records Available.—Daily discharges from October, 1912, to December, 1915. (Records for 1915 are given herein; preceding records are tabulated in previous reports).

Drainage Area.—The exact drainage area is not known, but it is very small.

Gauge.—Vertical staff. Gauge readings are taken twice a week by Mr. J. L. Davis.

Channel.—Boulders. The control is good.

Discharge Measurements.—Fifteen meter measurements made during 1912-13-14-15, give a well defined rating curve.

Winter Flow.—The lake freezes over, but the stream is free of ice at the gauge, throughout the winter.

Accuracy.—"C," because of infrequent gauge readings.

Co-operation.—The gauge readers are maintained by the Westminster Power Company.

Seymour Creek.—(1022).

Location.—Above the Vancouver waterworks intake, about 7 miles from the mouth.

Records Available.—Daily discharges from November, 1913, to December, 1915. Records for 1915 are given herein; preceding records are tabulated in previous reports).

Drainage Area.—Above the intake, 69 square miles, estimated by the Provincial Water Rights Branch.

Gauge.—Vertical staff gauge spiked to the cribbing at the intake. Gauge readings are taken daily by Mr. G. Skinner.

Channel.—Rocks and boulders; water swift at high stages.

Discharge Measurements.—Ten meter measurements made during 1913-14-15, give a well defined rating curve.

Winter Flow.—Open water all winter.

Accuracy.—"B."

Co-operation.—Gauge readings are made by the employees of the Vancouver Waterworks Department.

Discharge Measurements of Seymour River above Seymour Intake for 1915.

Silver-Pitt Creek.—(1017).

Location.—At lower end of canyon, about 2 miles from mouth of creek, in section 8, township 4, range 5, west of the 7th meridian.

Records Available.—Daily discharges from August, 1912, to December, 1915. (Records for 1915 are given herein; preceding records are tabulated in previous reports).

Drainage Area.—Seventy square miles, above gauging station.

Gauge.—Vertical staff gauge. Gauge readings are taken three times per week by Mr. J. L. Klein.

Channel.—Rocky bottom; permanent control.

Discharge Measurements.—Nine meter measurements made during 1912 13-14-15, give a well defined rating curve.

Winter Flow.—Open water all year.

Accuracy.—"C." Gauge readings only three times a week.

Co-operation.—None.

Skagit River.—(1055).

Location.—40 Miles from Hope and 4 miles from International boundary.

Records Available.—Daily discharges from March, 1915, to December, 1915.

Drainage Area.—Three hundred and fifty-six square miles, above the measuring section. Taken from the provincial government map of 1913.

Gauge.—Gurley automatic gauge.

Channel.—Fine gravel, good control, open current.

Discharge Measurements.—Five discharge measurements made during 1914-15, give a well defined rating curve.

Winter Flow.—The stream is affected by ice during the winter months.

Accuracy.—"C." Gauge was out of order for a short period.

Skagit River.—(1055).

The Skagit river rises in the mountains about 30 miles south-east of Hope and discharges into the Gulf of Georgia. Some of the mountains in its watershed rise to an elevation of 6,000 feet. It crosses the International boundary about 44 miles south-east of Hope. About 360 square miles of its drainage basin are in Canada.

The precipitation in the Skagit river basin is probably about 90 inches per annum. In the winter the snowfall is fairly heavy. The stream freezes over in many places and is usually affected by ice during January and February.

The Boundary pack trail follows the Skagit river from the Hope-Princeton trail to the boundary, a distance of about 20 miles. When the Pacific highway is completed it will greatly facilitate transportation in this part of the country.

There is very little development or settlement in the Skagit river valley, in Canada. There are some mining prospects but little more than assessment work has been done as yet. The valley near the boundary has some possibilities as a stock raising country.

There is a proposal to divert water from the Sumallo river, a tributary of the Skagit, into the lakes which feed the Nicolum river. This would augment the flow of the Nicolum sufficiently to make a power development practicable. It is possible to obtain a head of 2,000 feet.

In connection with the above-mentioned plan of development, this survey has established four gauging stations, located as follows; the Skagit river, four miles from the boundary, the Sumallo river, one mile from its mouth, the Sumallo river, eight miles from its mouth, and the Nicolum river, five miles from its mouth. A Gurley automatic gauge was installed on the Skagit river, four miles from the boundary, in March, 1915.

Discharge Measurements of Skagit River 4 Miles above International Boundary for 1915.

The period	1,305	50	575	1.61	16.48	313,290

Note.—Station established on March 27, 1915.

South Lillooet River.—(1018).

Location.—At upper highway bridge, eight miles from mouth, in section 28, township 12, east of the coast meridian.

Records Available.—Daily discharges from October, 1911, to December, 1915.

Drainage Area.—One hundred square miles.

Gauge.—Chain gauge on bridge, also vertical staff gauge on cribbing. Gauge readings are taken daily by Mr. F. Spink.

Channel.—Permanent rocky channel.

Discharge Measurements.—Twelve meter measurements during 1911-12-13-14-15, give a well defined rating curve.

Winter Flow.—Open water all year.

Accuracy.—"B."

Sumallo River.—(1056).

Location.—One mile from mouth and just south of the railway belt boundary.

Records Available.—Daily discharges from July, 1914, to December, 1915. (Records for 1915 are given herein; those for 1914 are tabulated in a previous report).

Drainage Area.—Above the mouth, 70 square miles.

Gauge.—Vertical staff. Gauge readings are taken daily by Mr. W. H. Robinson.

Channel.—Rocky, with good control.

Discharge Measurements.—Twelve meter measurements by the engineers of the British Columbia Hydrometric Survey, and one by L. N. Jensen, in 1914 and 1915. One measurement was under ice conditions.

Winter Flow.—Stream open all winter, but during very cold weather anchor ice affects the relation between gauge height and discharge.

Accuracy.—"B."

Co-operation.—Four meter measurements were made during 1913 and 1914 by L. N. Jensen for MacKenzie & Mann.

Discharge Measurements of Sumallo River 1 Mile above Mouth for 1915.

Sumallo River.—(1057).

Location.—Eight miles from mouth, in section 28, township 3, range 24, west of 6th meridian.

Records Available.—Irregular records from July, 1914, to December, 1915. (Records for 1915 are given herein; those for 1914 are tabulated in a previous report.

Drainage Area.—Seventeen square miles (measured from Dominion map of 1913, scale 3 miles to the inch).

Gauge.—Vertical staff. Gauge readings taken by W. H. Robinson and W. N. Thacker. Gauge readings are very irregular.

Channel.—Gravel.

Discharge Measurements.—Ten meter measurements made during 1914 and 1915 give a well defined rating curve. One measurement was made under ice conditions.

Winter Flow.—Station is somewhat affected by ice during very cold weather.

Accuracy.—"D," because of infrequent gauge readings.

Young Creek.—(1020).

Location.—At mouth, in section 10, township 7, range 7, west of the 7th meridian.

Records Available.—Daily discharges from October, 1912, to December, 1915. (Records for 1915 are given herein; preceding records are tabulated in a previous report.)

Drainage Area.—Not determined.

Gauge.—Vertical staff. Gauge readings are taken twice a week by Mr. J. L. Davis.

Channel.—Solid rock.

Discharge Measurements.—Twelve meter measurements made during 1912-13-14-15, give a well defined rating curve.

Winter Flow.—Very heavy snowfall, but little ice, so that open water conditions prevail all winter.

Accuracy.—"C" and "D," because of infrequent gauge readings.

Co-operation.—Gauge readings maintained by the Westminster Power Company.

LILLOOET DISTRICT.

Brandywine River.—(1065).

Location.—Highway Bridge, above Falls; 27 miles from Squamish.

Records Available.—Daily discharges from May 26, 1915, to December 31, 1915.

Drainage Area.—Not determined.

Gauge.—Vertical staff. Gauge readings are taken daily by Mr. G. C. Turpin.

Channel.—Rocky, and covered with boulders. The control is good.

Discharge Measurements.—Six meter measurements, taken during 1915, give a well defined rating curve except for very high stages of the water.

Winter Flow.—The stream is affected by ice during the winter months.

Accuracy.—"B."

Brandywine River.—(1065).

The Brandywine river rises in the mountains, north of Squamish, and discharges into the Cheakamus river about eighteen miles above the mouth.

On the Brandywine watershed the climate is much similar to that of the Cheakamus valley. The total annual precipitation is about ninety inches.

The main line of the Pacific Great Eastern Railway crosses the stream about a mile from its mouth.

Just below the railway trestle the river has a perpendicular fall of about two hundred feet. With a minimum discharge of forty cubic feet a second, about 600 horse-power could be developed very cheaply. This might well be used as a temporary power plant for a larger development on the Cheakamus river.

The surrounding country contains many mineral deposits and, although considerable prospecting is being done at the present time, very few claims have been developed to any extent.

There is a small quantity of timber and a little agricultural land near the mouth of the stream.

Discharge Measurements of Brandywine River 1 Mile above Mouth for 1915.

Monthly Discharge of Brandywine River above Falls for 1915.

Month.	Discharge in Second-Feet.				Run-Off.	
	Maximum.	Minimum.	Mean.	Per square mile.	Depth in inches on Drainage area.	Total in acre-feet.
June	610	180	300			
July	490	125	251			
August	340	110	191			
September	180	40	67			
October	1,120	30	168			
November	340	45	92			
December	180	40	61			
The period	1,120	30	160			

Note.—Station established May, 1915.

Bridge River.—(1045).

Location.—Thirty miles above mouth and ten miles from Mission, on Seton lake.

Records Available.—Daily discharges from October 7th, 1913, to December 31st, 1915. (Records for 1915 are given herein; preceding records are tabulated in previous reports.)

Drainage Area.—The Provincial map (scale 17.75 miles to the inch) shows a drainage area of 1,900 square miles above gauging station.

Gauge.—Vertical staff gauge. The gauge reader is Mr. A. Vierra, of Bridge River. Readings are taken twice a day.

Channel.—Wide and deep, with sand and mud bottom, and excellent measuring section.

Discharge Measurements.—Eleven meter measurements taken during 1913-14-15 give a well defined rating curve.

Winter Flow.—The stream is frozen over during the colder winter months.

Accuracy.—"A."

Co-operation.—Gauge readings taken in co-operation with the Bridge River Power Company.

Discharge Measurements of Bridge River 30 Miles above Mouth for 1915.

Cayuse Creek.—(1048).

Location.—At the Pacific Great Eastern Railway trestle, 2 miles from the mouth, and 2½ miles from Lillooet.

Records Available.—Daily discharges from April 8th, 1914, to December 31st, 1915. (Records for 1915 are given herein; for 1914 see previous report.)

Drainage Area.—Three hundred and fifty square miles (measured from the Provincial map of 1912, scale 12 miles to the inch).

Gauge.—Vertical staff gauge, nailed to a pile of the false work of the trestle. Daily gauge readings are taken by Mr. S. Marshall, of Lillooet, B.C.

Channel.—Wide, and of moderate depth, strewn with boulders and coarse gravel. The current is swift at the higher stages. The metering section is a good one.

Discharge Measurements.—Nine discharge measurements taken during 1914 and 1915 give a well defined rating curve.

Winter Flow.—The stream is affected by ice conditions during the winter months.

Accuracy.—"B."

Discharge Measurements of Cayuse River above Seton Creek for 1915.

Cheakamus River.—(1034).

Location.—Highway bridge, about 1 mile from the mouth and 10 miles from Squamish.

Records Available.—Daily discharges from March 11, 1914, to December 31, 1915. (Records for 1915 are given herein, for 1914, see previous report.)

Drainage Area.—Above the measuring section, 250 square miles (from the Provincial map of 1912, scale 17.75 miles to the inch).

Gauge.—Cable gauge from the highway bridge. Daily gauge readings by Mr. C. Voeltzel.

Channel.—Wide and shallow. The bed is rough and strewn with boulders.

Discharge Measurements.—Thirteen discharge measurements were made during 1914 and 1915.

Winter Flow.—Open water conditions all winter.

Accuracy.—"C."

September	4,850	1,650	2,180	8.72	9.73	130,000
October	9,125	990	2,930	11.80	13.60	180,000
The period	12,880	450	2,542	10.17	115.57	1,541,000

Note.—No continuous readings during November and December.

Foster Bar Creek.—(1074).

Location.—Above the irrigation ditches, 19 miles below Lillooet.

Records Available.—Daily discharges from June 22 to September 30, 1915.

Drainage Area.—Twenty square miles.

Gauge.—Vertical staff gauge. Daily gauge readings are taken by Mr. C. McGillivary of the Halfway House, Lytton, B.C.

Channel.—Boulders and gravel, with good control.

Discharge Measurements.—Three discharge measurements give a well defined rating curve for the range of the stream.

Winter Flow.—The gauge is only read during the irrigation season.

Accuracy.—"B."

Foster Bar Creek.—(1074).

Foster Bar creek rises in the mountains south-west of Lillooet, flows in a south-westerly direction and discharges into the Fraser river, twenty-three miles below Lillooet, at an elevation of 450 feet. The drainage area is twenty square miles.

The climate in the watershed of this stream is much similar to that of the Lillooet district. The summers are hot and the winters rather severe. The mean annual precipitation is about ten inches. This increases very much with the altitude.

The Fraser river benches adjacent to the mouth of this stream are well suited to cultivation when irrigated. At present the normal flow of the stream is being used for this purpose. So far no investigations have been made with a view to storing the high water flow.

Discharge Measurements of Foster Bar Creek above Irrigation Ditches for 1915.

The period	3.7	1.0	2.04	0.10	0.35	375.5

Note.—Station established in July, 1915, and maintained throughout the irrigation season.

FOUNTAIN CREEK.—(1047).

Location.—Above the irrigation ditches, 1½ mile from the mouth and 10 miles from Lillooet.

Records Available.—Daily discharges from June to October, 1914, and from April to October, 1915. (Records for 1915 are given herein, those for 1914 are tabulated in a previous report.)

Drainage Area.—Twenty square miles (measured from the Provincial map of 1913, scale 12 miles to the inch).

Gauge.—Vertical staff gauge. Daily gauge readings are taken by Mr. E Peterson, of Lillooet, B.C.

Channel.—Wide and shallow, gravel bottom. The current is fairly swift. The control is good.

Discharge Measurements.—Five discharge measurements taken during 1915 give a fairly well defined rating curve.

Winter Flow.—The gauge readings are discontinued during the winter months.

Accuracy.—"C."

September	2	2	2.0	0.10	0.11	119
The period	39	1	14.2	0.70	4.03	4,309

Note.—Station maintained only during the irrigarion season; that is from May to September, 1915.

Fraser River.—(1072).

at Lillooet.

Location.—Pacific Great Eastern Railway trestle at Lillooet.

Records Available.—Daily discharges from May 14, to December 31, 1915.

Drainage Area.—Sixty-two thousand five hundred square miles—from Provincial map of 1912.

Gauge.—Cable gauge from the trestle. Gauge readings are taken twice a day by Mr. J. W. Burke, of Lillooet, B.C.

Channel.—Wide, and fairly deep. The current is very swift at the higher stages of the water. The bottom is covered with gravel and boulders.

Discharge Measurements.—Three discharge measurements, taken in 1915, outline the rating curve.

Winter Flow.—Open water throughout the year.

Accuracy.—"D," because of insufficient meter measurements.

Fraser River at Lillooet.—(1072).

For a complete description of the Fraser river refer to the report of the Railway Belt Hydrometric Survey, 1911-12, Water Resources Paper No. 1.

This station was established at Lillooet on May 14, 1915, to obtain accurate data on the discharge of the Fraser river above its confluence with the Thompson river. The gauge on the Fraser at Lytton was found to be affected by backwater from the Thompson river.

Discharge Measurements of Fraser River at Lillooet, B.C., for 1915.

November	48,800	12,200	27,100	0.43	0.48	1,610,000
December	20,400	10,400	13,700	0.22	0.25	842,000
The period	145,000	10,400	63,543	1.01	8.09	26,982,000

Note.—Station established May 14, 1915.

Green River at Nairn Falls.—(1035).

Location.—Five miles from the mouth, 3 miles from Pemberton.

Records Available.—Daily discharges from November, 1913, to December, 1915. (Records for 1915 are given herein; preceding records are tabulated in previous reports.)

Drainage Area.—Drainage area, as measured from the Provincial map of 1912 (scale 17.75 miles to the inch), is 180 square miles.

Gauge.—Sloping staff gauge bolted to rocks. Daily gauge readings are taken by Mr. L. Merson, of Pemberton, B.C.

Channel.—Wide and fairly deep. Rock and gravel bottom,—a good metering section with a good control.

Discharge Measurements.—Twenty-seven meter measurements taken during 1913-14-15 give a very well defined rating curve.

Winter Flow.—The stream is affected by ice during the winter months.

Accuracy.—"A" below discharge of 13,300 cubic feet per second.

"B" above discharge of 13,300 cubic feet per second.

Discharge Measurements of Green River above Nairn Falls for 1915.

Laluwissin Creek.—(1050).

Location.—Above the irrigation ditches, about 1 mile from the mouth and 26 miles from Lillooet, section 30, township 27, range 17, west of 6th meridian.

Records Available.—Daily discharges from June to September, 1914, and from April to December, 1915. (Records for 1915 are given herein; those for 1914 are tabulated in a previous report.)

Drainage Area.—Twenty square miles (measured from the Provincial map of 1913, scale 12 miles to the inch.)

Gauge.—Vertical staff gauge. Daily gauge readings taken by Mr. J. E. Maher, of Lillooet, B.C.

Channel.—Shallow, and strewn with boulders and coarse gravel. The current is fairly swift. The metering section is a good one.

Discharge Measurements.—Four meter measurements taken during 1915 give a well defined rating curve.

Winter Flow.—Stream affected by ice in winter months.

Accuracy.—"B."

Discharge Measurements of Laluwissin Creek above Irrigation Ditches for 1915.

Monthly Discharge of Laluwissin River above Irrigation Ditches for 1915.

(Drainage area, 20 square miles.)

Month.	Discharge in Second-Feet.				Run-Off.	
	Maximum.	Minimum.	Mean.	Per square mile.	Depth in inches on Drainage area.	Total in acre-feet.
May	29.0	6.0	15.50	0.78	0.90	953
June	20.0	6.0	11.50	0.58	0.65	684
July	8.1	3.7	5.39	0.27	0.31	331
August	6.3	2.0	3.60	0.18	0.21	221
September	2.8	1.6	2.33	0.12	0.13	139
October	2.8	2.0	2.29	0.11	0.13	141
November	2.8	1.6	1.87	0.09	0.10	111
December	2.0	1.6	1.81	0.09	0.10	111
The period	29.0	1.6	5.54	0.28	2.53	2,691

Note.—Station maintained throughout the irrigation season and also till end of year for storage data.

Lillooet River.—(1038).

Location.—Government highway bridge at Agerton, 1½ mile from Pemberton, and 8 miles above Lillooet lake.

Records Available.—Daily discharges from November 16, 1913, to December 31, 1915. (Records for 1915 are given herein; preceding records are tabulated in previous reports.)

Drainage Area.—Eight hundred square miles.

Gauge.—Vertical staff gauge nailed to the central pier of the bridge. Daily gauge readings are taken by Mr. N. J. Baker, of Pemberton, B.C.

Channel.—Wide and deep, with smooth sandy bottom. An excellent measuring section.

Discharge Measurements.—Twelve meter measurements taken during 1914 and 1915 give a well defined rating curve.

Winter Flow.—The stream is affected by ice conditions during the winter months.

Accuracy.—"A."

Pavilion Creek.—(1073).

Location.—Above the ditches, 22 miles above Lillooet.

Records Available.—Daily discharges from June 19 to September 30, 1915.

Drainage Area.—Eighty-two square miles, taken from the Provincial Government map, 1913.

Gauge.—Vertical staff gauge. Daily gauge readings are taken by Mr. C. A. Shaw.

Channel.—Wide and shallow. The bottom is of sand and gravel.

Discharge Measurements.—Three discharge measurements taken during 1915 define the rating curve fairly well.

Winter Flow.—Records kept only during the irrigation season.

Accuracy.—"B."

Pavilion Creek.—(1073).

Pavilion creek rises in the mountains west of Pavilion, flows in a southwesterly direction and discharges into the Fraser river twenty-two miles above Lillooet. It drains Pavilion lake which is about three miles long and a third of a mile wide.

It has two large tributaries, both entering from the right. The total drainage area of Pavilion creek is 82 square miles.

The climate in the Pavilion creek valley resembles that of the Lillooet district generally. The summers are very hot, and the winters severe. The mean annual precipitation in the watershed is about ten inches.

The valley of Pavilion creek and its tributaries, and the adjacent benches on the Fraser river are well adapted to cultivation by irrigation; the water from the stream being used for this purpose. Some attempt has been made to regulate the flow to give sufficient water for the low water season. A small timber dam

at the outlet of the lake stores the water which comes down during the spring and early summer freshets. When this water is required a sluice gate in the dam is opened and the water is allowed to flow down the natural channel of the stream to the irrigation ditches.

Considerable water is diverted from the tributaries which are above the gauging station.

The discharge data given for this stream is computed from the flow at the metering section and does not include water diverted above the section.

Discharge Measurements of Pavilion Creek above Irrigation Ditches for 1915.

Monthly Discharge of Pavilion Creek near Pavilion, B.C., for 1915.

(Drainage area, 82 square miles.)

Month.	Discharge in Second-Feet.				Run-Off.	
	Maximum.	Minimum.	Mean.	Per square mile.	Depth in inches on Drainage area.	Total in acre-feet.
July	24.0	8.0	12.10	0.15	0.17	744
August	21.0	11.2	15.00	0.18	0.21	922
September	21.0	2.6	9.75	0.12	0.13	580
The period	24.0	2.6	12.28	0.15	0.51	2,246

Note.—The station was established in June, 1915, and gauge readings were continued throughout the irrigation season; that is, to September 30, 1915.

Seton Creek.—(1049).

Location.—At the foot bridge at the provincial hatchery, ½ mile below Seton lake, and 3 miles from Lillooet.

Records Available.—Daily discharges from April 6, 1914, to December 31, 1915. (Records for 1915 are given herein; those for 1914 are tabulated in a previous report.)

Drainage Area.—460 square miles, measured from the Provincial map of 1912 (scale 12 miles to the inch).

Gauge.—Vertical staff gauge nailed to bridge pier. Daily gauge readings are taken by Mr. J. B. Arthur of the Provincial hatchery, Lillooet, B.C.

Channel.—Wide and shallow, strewn with boulders. The current is very swift at the higher stages of the water.

Discharge Measurements.—Nine discharge measurements taken during 1914 and 1915 give a well defined rating curve.

Winter Flow.—Open water conditions all year.

Accuracy.—"B."

Six Mile Creek.—(1061).

Location.—At the highway bridge 1 mile from the mouth, 5 miles from Pemberton, and 56 miles from Squamish.

Records Available.—Daily discharges from June 2, 1914, to April 30, 1915. (Records for 1915 are given herein; those for 1914 are tabulated in a previous report.)

Drainage Area.—Thirty square miles (measured from the Provincial map of 1913, scale 3 miles to the inch).

Gauge.—Vertical staff gauge on bridge pier. Daily gauge readings are taken by Mr. C. E. Dobbie.

Channel.—Wide and shallow. Strewn with boulders and coarse gravel. The current is very swift.

Discharge Measurements.—Five meter measurements made during 1914-15 give a well defined rating curve, except for very high stages of the water.

Winter Flow.—The stream is affected by ice only during the extreme cold weather.

Accuracy.—"C."

March	350	47	147	4.90	5.65	9,040
April	910	215	394	13.13	14.65	23,400
The period	910	35	161	5.37	24.13	38,580

Note.—Discontinued April 30th, 1915.

Soo River.—(1037).

Location.—At the highway bridge, 2 miles from the mouth, 6½ miles from Pemberton, and 56 miles from Squamish.

Records Available.—Daily discharges from December 5, 1914, to April 30, 1915. (Records for 1915 are given herein; those for 1914 are tabulated in a previous report.)

Drainage Area.—Seventy-five square miles (measured from the Provincial map of 1912, scale 3 miles to the inch).

Gauge.—Vertical staff gauge on bridge pier. The gauge readings are taken daily by C. E. Dobbie.

Channel.—Wide and shallow, strewn with boulders, gravel and silt. The current is fairly swift.

Discharge Measurements.—Seven meter measurements made in 1915 give a well defined rating curve.

Winter Flow.—The measuring section is usually frozen over and the channel is affected by ice during the winter.

Accuracy.—"B."

April	1,630	465	767	10.23	11.41	45,600
The period	1,630	25	304	4.05	18.21	72,820

NOTE.—Discontinued April 30th, 1915.

Texas Creek.—(1044).

Location.—At the highway bridge, 14 miles from Lillooet, on the west bank of the Fraser river.

Records Available.—Daily discharges from April to September, 1914, and from April to September, 1915. (Records for 1915 are given herein; those for 1914 are tabulated in a previous report.)

Drainage Area.—Fifty square miles (measured from the Provincial map of 1912, scale 12 miles to the inch).

Gauge.—Vertical staff gauge nailed to the bridge pier. Gauge readings are taken three times a week by Mr. C. Armstrong, of Lillooet, B.C.

Channel.—Wide and shallow, and covered with boulders. The measuring section is rather poor but it is the best obtainable.

Discharge Measurements.—Four meter measurements taken during 1915 give a well defined rating curve.

Winter Flow.—Records kept only during the irrigation season.

Accuracy.—"C."

Monthly Discharge of Texas Creek ½ Mile above Mouth, 14 Miles below Lillooet, for 1915.

(Drainage area, 50 square miles.)

Month.	Discharge in Second-Feet.				Run-Off.	
	Maximum.	Minimum.	Mean.	Per square mile.	Depth in inches on Drainage area.	Total in acre-feet.
May	500	153	352.0	7.04	8.12	21,600
June	545	294	370.0	7.40	8.26	22,000
July	410	180	281.0	5.62	6.48	17,300
August	180	77	130.0	2.60	3.00	7,990
September	70	43	52.1	1.04	1.16	3,160
The period	545	43	237.0	4.74	27.02	72,050

Note.—Station maintained only during irrigation season, May to September, 1915.

VANCOUVER ISLAND DISTRICT.

Big Qualicum River.—(1032).

Location.—One thousand feet upstream from Esquimalt and Nanaimo Railway bridge. Twenty miles from Parksville.

Records Available.—Daily discharges, March 23, 1913, to April 30, 1914, May 21, 1914, to December 31, 1915. (Records for 1915 are given herein; preceding records are tabulated in previous reports.)

Drainage Area.—Sixty-two square miles.

Gauge.—Eighteen foot wooden staff, location on left bank about one hundred feet above railroad bridge; read daily by Mr. Leon Becque.

Channel.—Even gravel bed. Channel straight for 300 feet above and below section.

Discharge Measurements.—One in 1913 by Provincial Water Rights Branch, four in 1914 and three in 1915. Covering all but highest stage.

Winter Flow.—Open all year.

Accuracy.—"B" (up to discharge of 450 cubic feet per second), "C" (above 450 cubic feet per second).

Co-operation.—Gauge installed in 1913 by Provincial Water Rights Branch, and records to April 30, 1914, supplied by that branch.

Discharge Measurements of Big Qualicum River at 1½ Mile above Mouth for 1915.

Date.	Engineer.	Meter No.	Width.	Area of Section.	Mean Velocity.	Gauge Height.	Discharge.

Campbell River.—(1042).

Location.—At outlet from Campbell lake.

Records Available.—Daily discharges, May 10, 1910, to December 31, 1915. (Records for 1915 are given herein; preceding records are tabulated in previous reports.)

Drainage Area.—Seven hundred and eighty square miles.

Gauge.—Twelve-foot enamel staff in sections, located one thousand feet above measuring section. Read twice daily by James Forbes.

Channel.—Gravel and boulder bed. Channel straight for 200 feet above section. Rapids 100 feet below section.

Discharge Measurements.—Four in 1914, six in 1915, covering all stages.

Winter Flow.—Open all year.

Accuracy.—"B" (up to discharge of 4,000 cubic feet per second). "C" (above 4,000 cubic feet per second).

Co-operation.—Gauge records previous to June 2, 1914, supplied by Campbell River Power Company. A cable car was also established in conjunction with this power company.

Discharge Measurements of Campbell River at Campbell Lake for 1915.

Chemainus River.—(1027).

Location.—Upstream side of Esquimalt and Nanaimo Railway bridge, 5 miles from Chemainus—low water measurements made by wading.

Records Available.—Daily discharges May 13, 1914, to December 31, 1915. (Records for 1915 are given herein; those for 1914 are tabulated in a previous report.)

Drainage Area.—One hundred and twenty square miles.

Gauge.—Eighteen-foot wooden staff, located on left bank, 100 feet below bridge. Read daily by Mr. R. C. Mainguy.

Channel.—Straight for 150 feet above and 300 feet below section. Gravel and sand bed.

Discharge Measurements.—Six in 1914, three in 1915, covering all but highest stage.

Winter Flow.—Open all year.

Accuracy.—"A" (up to discharge of 600 cubic feet per second). "C" (above 600 cubic feet per second).

Cowichan River.—(1054).

Location.—Near outlet from Cowichan lake, 500 feet below Canadian Northern Pacific Railway bridge, except for low water.

Records Available.—Daily discharges January 31, 1913, to December 31, 1915. (Records for 1915 are given herein; preceding records are tabulated in previous reports.)

Drainage Area.—Two hundred and thirty-five square miles.

Gauge.—Twelve foot wooden staff at highway bridge at outlet from lake, near left bank. Gauge read twice daily by Mr. C. E. Sherwood and Mr. H. T Hardinge.

Channel.—Gravel and small boulder bed. Channel straight for 200 feet above and below section.

Discharge Measurements.—Five in 1913, by Provincial Water Rights Branch, four in 1914 and four in 1915, covering all stages.

Winter Flow.—Open all year.

Accuracy.—"B"—*Note:*—The accuracy of 1914 discharges is not good owing to errors in gauge records.

Co-operation.—Provincial Water Rights Branch established station in 1913.

Discharge Measurements of Cowichan River at Cowichan Lake for 1915.

The year	4,980	32	1,410	6.00	81.24	874,810

Englishmans River.—(1030).

Location.—One-half mile above mouth, 2 miles from Parksville.

Records Available.—Daily discharges February 15, 1913, to December 31, 1913, May 19, 1914, to September 21, 1914, December 9, 1914, to December 31, 1915. (Records for 1915 are given herein; preceding records are tabulated in previous reports.)

Drainage Area.—One hundred and eleven square miles.

Gauge.—Twelve-foot enamelled staff in 2 sections, located on right bank, 100 feet upstream from metering section. Read daily by Mr. L. Mandley.

Channel.—Straight for 300 feet above and below section, even gravel bed.

Discharge Measurements.—Four in 1913, by Provincial Water Rights Branch, four in 1914, and three in 1915.

Winter Flow.—Open all year.

Accuracy.—"B" (between discharge of 100 and 600 cubic feet per second "C" (below discharge of 100 and above 600 cubic feet per second). This accuracy is kept low on account of the shifting of channel each year.

Co-operation.—Provincial Water Rights Branch established station in 1913.

Discharge Measurements of Englishmans River 1½ Mile above Mouth for 1915.

Date.	Engineer.	Meter No.	Width.	Area of Section.	Mean Velocity.	Gauge Height.	Discharge.

Haslam Creek.—(1029).

Location.—Low water section 500 feet below Canadian Collieries Railway bridge, 6 miles from Ladysmith.

High water section downstream side of bridge.

Records Available.—Daily discharges July 3, 1914, to July 31, 1915. Station discontinued as stream was considered of little importance. (Records for 1915 are given herein; those for 1914 are tabulated in a previous report.)

Drainage Area.—Twenty-seven square miles.

Gauge.—Six-foot enamel staff on piling of railway bridge, left bank, read bi-weekly by Mr. J. B. Wier.

Channel.—Low water section—gravel bed, channel straight 50 feet above and below section.

High water section—stream flows at small angle to bridge, gravel bed.

Discharge Measurements.—Four in 1914, one in 1915, covering all but high stage.

Winter Flow.—Open all year.

Accuracy.—"B" (up to discharge of 160 cubic feet per second). "C" (above 160 cubic feet per second).

Note.—Station discontinued July, 1915.

Koksilah River.—(1026).

Location.—Two miles from mouth, upstream side of Esquimalt and Nanaimo Railway bridge.

Records Available.—Daily discharges May 12, 1914, to December 31, 1915. (Records for 1915 are given herein; those for 1914 are tabulated in a previous report.)

Drainage Area.—One hundred and twenty-four square miles.

Gauge.—Fourteen-foot staff on left bank, 600 feet above bridge, read daily by Koksilah Charlie.

Channel.—Gravel bed, channel straight for 100 feet above and 300 feet below section, 2 channels at low water.

Discharge Measurements.—Six in 1914, three in 1915, covering all stages.

Winter Flow.—Open all year.

Accuracy.—"A" (up to discharge of 400 cubic feet per second). "B" (between discharge of 400 and 2,000 cubic feet per second). "C" (above discharge of 2,000 cubic feet per second).

Little Qualicum River.—(1031).

Location.—At outlet from Cameron lake, downstream side of highway bridge.

Records Available.—Daily discharges February 27, 1913, to December 31, 1915. (Records for 1915 are given herein; preceding records are tabulated in previous reports.)

Drainage Area.—Fifty-four square miles.

Gauge.—Twelve foot wooden staff nailed to crib near shore of lake, 500 feet from head of river. Read twice daily by Mr. T. B. McBey.

Channel.—Straight on both sides of section for 100 feet. Even gravel bed. Confined by bridge abutments in high water.

Discharge Measurements.—Eight in 1913 and 1914, by Provincial Water Rights Branch, seven in 1914 and 1915, covering all stages.

Winter Flow.—Open all year.

Accuracy.—"A" (between discharge of 30 and 600 cubic feet per second.) "B" (between discharge of 600 and 1,000 cubic feet per second.) "C" (above discharge of 1,000 cubic feet per second).

Co-operation.—Provincial Water Rights Branch established station in 1913.

Discharge Measurements of Little Qualicum River at Cameron Lake for 1915.

Nanaimo River.—(1028).

Location.—Six miles from mouth, 800 feet upstream from Canadian Collieries Railway bridge, 8 miles from Ladysmith.

Records Available.—Daily discharges February 11, 1913, to December 31, 1915. (Records for 1915 are given herein: preceding records are tabulated in previous reports.)

Drainage Area.—Two hundred and forty-nine square miles.

Gauge.—Twelve-foot wooden staff nailed to tree, left bank, 25 feet above section. Gauge read daily by Miss Jeane Whisker.

Channel.—Straight for 200 feet on either side of section, even gravel bed, good control 400 feet downstream.

Discharge Measurements.—One in 1911, four in 1913, and two in 1914, by Provincial Water Rights Branch; two in 1914 and three in 1915, covering all but highest stage.

Winter Flow.—Open all year.

Accuracy.—"B" (up to discharge of 3,000 cubic feet per second). "C" (above discharge of 3,000 cubic feet per second).

Co-operation.—Provincial Water Rights Branch established station in 1913.

Discharge Measurements of Nanaimo River 6 Miles above Mouth for 1915.

Oyster River.—(1040).

Location.—One mile above mouth, upstream side of Island Highway bridge, 18 miles from Courtenay.

Records Available.—Daily discharges June 1, 1914, to December 31, 1915. (Records for 1915 are given herein; those for 1914 are tabulated in a previous report.)

Drainage Area.—Seventy square miles.

Gauge.—Twelve-foot enamel staff, nailed to cribbing on right bank, 20 feet downstream from bridge.

Channel.—Straight for 100 feet above and 400 feet below section; stream flows at a small angle to bridge.

Discharge Measurements.—Four in 1914, four in 1915, covering all but highest stage.

Winter Flow.—Open all year.

Accuracy.—Channel shifts each year. "B" (up to discharge of 1,900 cubic feet per second). "C" (above discharge of 1,900 cubic feet per second).

Discharge Measurements of Oyster River 1 Mile above Mouth for 1915.

Date.	Engineer.	Meter No.	Width.	Area of Section.	Mean Velocity.	Gauge Height.	Discharge.
			Feet.	Sq. ft.	Ft. per sec.	Feet.	Sec.-ft.

Puntledge River at Courtenay.—(1036).

Location.—One mile from mouth, downstream side of highway bridge, 1 mile from Courtenay.

Records Available.—Daily discharges May 30, 1914, to December 31, 1915. (Records for 1915 are given herein; those for 1914 are tabulated in a previous report.)

Drainage Area.—Two hundred square miles.

Gauge.—Fourteen-foot wooden staff nailed to piling of right abutment of railway bridge.

Channel.—Straight for 800 feet upstream and 200 feet downstream from section, 2 channels at extreme high water.

Discharge Measurements.—Four in 1914, three in 1915, covering all but highest stage.

Winter Flow.—Open all year.

Accuracy.—"B" (between discharge of 400 and 4,000 cubic feet per second). "C" (below 400 and above 4,000 cubic feet per second).

Puntledge River at Diversion Dam.—(1063).

Location.—At Diversion dam of Puntledge River Hydro-Electric Installation, Canadian Collieries (Dunsmuir), Ltd.

Records Available.—Daily discharges June 7, 1913, to December 31, 1915. Supplied by Canadian Collieries, Ltd. (Records for 1915 are given herein; preceding records are tabulated in previous reports.)

Drainage Area.—One hundred and seventy-five square miles.

Gauge.—Wooden staff located on right bank 50 feet above diversion dam.

Channel.—Even flow over crest of dam. Water flowing through flume to intake is added, giving total flow of stream.

Discharge Measurements.—Daily discharges obtained by weir measurements over dam plus water to flume.

Winter Flow.—Open all year.

Co-operation.—All data on this station supplied by Canadian Collieries (Dunsmuir), Ltd.

Note.—This data was supplied by the Canadian Collieries Co. (Dunsmuir) Ltd.

Shawnigan Creek.—(1025).

Location.—Five hundred feet from outlet of Shawnigan lake. Upstream side of Esquimalt and Nanaimo Railway bridge.

Records Available.—Daily discharges May 11, 1914, to December 31, 1915. (Records for 1915 are given herein; those for 1914 are tabulated in a previous report.)

Drainage Area.—Twenty-two square miles.

Gauge.—Nine foot enamel staff, nailed to piling on left downstream side of highway bridge at outlet from lake. Gauge read daily by Mr. G. B. Aitkens.

Channel.—Straight for 50 feet on either side of section, gravel and sand bed.

Discharge Measurements.—Four in 1914, three in 1915, covering all stages.

Winter Flow.—Open all year.

Accuracy.—"A" (up to discharge of 280 cubic feet per second). "B" (above 280 cubic feet per second).

Sproat River.—(1051).

Location.—Eight hundred feet below outlet from Sproat lake, 8 miles from Alberni.

Records Available.—Daily discharges March 1, 1913, to December 31, 1915. (Records for 1915 are given herein; preceding records are tabulated in previous reports.)

Drainage Area.—One hundred and twenty-eight square miles.

Gauge.—Twelve-foot wooden staff nailed to crib on lake shore, 300 feet to right of outlet. Gauge read daily by Mr. H. Weiner.

Channel.—Slight curve at section, straight for 500 feet above and below section, gravel and boulder bed, solid rock on left side, good control.

Discharge Measurements.—Six in 1913, by Provincial Water Rights Branch, four in 1914, and two in 1915.

Winter Flow.—Open all year.

Accuracy.—"A" (up to discharge of 2,500 cubic feet per second). "B" (between discharge of 2,500 and 6,000 cubic feet per second). "C" (above 6,000 cubic feet per second).

Co-operation.—Provincial Water Rights Branch established station in 1913.

Discharge Measurements of Sproat River at Sproat Lake for 1915.

Stamp River at Great Central Lake.—(1052).

Location.—Three hundred feet below outlet from Great Central lake, 16 miles from Alberni.

Records Available.—Daily discharges February 20, 1913, to December 31, 1915. (Records for 1915 are given herein; preceding records are tabulated in previous reports.)

Drainage Area.—One hundred and seventy-seven square miles.

Gauge.—Twelve-foot wooden staff nailed to crib in lake, 300 feet to right of outlet. Gauge read twice daily by Mr. J. Drinkwater.

Channel.—Straight for 300 feet above and 100 feet below section, rocky bed, some boulders. At extreme high water stage there is a discharge from slough 1,000 feet to right of stream.

Discharge Measurements.—Seven in 1913, by Provincial Water Rights Branch; four in 1914, and two in 1915, covering all but highest stage.

Winter Flow.—Open all year.

Accuracy.—"A" (between discharge of 250 and 3,500 cubic feet per second). "B" (below 250 and between 3,500 and 5,000 cubic feet per second). "C" (above 5,000 cubic feet per second).

Co-operation.—Station established in 1913 by Provincial Water Rights Branch.

Stamp River at Stamp Falls.—(1053).

Location.—One-quarter mile above falls, 8 miles from Alberni, on Beaver Creek road.

Records Available.—Daily discharges March, 1913, to May 31, 1914. Messrs. Ritchie Agnew, engineers, Victoria, B.C. Daily discharges June 1, 1914, to December 31, 1915. (Records for 1915 are given herein; preceding records are tabulated in previous reports.)

Drainage Area.—Three hundred and thirty-six square miles.

Gauge.—Fourteen-foot wooden staff on left bank, 80 feet below measuring section. Gauge read daily by Mr. Robt. Darby.

Channel.—Straight for 600 feet above and 300 feet below section. Rock bed with gravel, good condition.

Discharge Measurements.—Numerous measurements made by Messrs. Ritchie Agnew Co., during 1913 and 1914, three in 1914 and one in 1915, covering all stages.

Winter Flow.—Open all year.

Accuracy.—"B".

Co-operation.—Station established in 1913 by Messrs. Ritchie Agnew Co.

Tsolum River.—(1039).

Location.—Upstream side of foot bridge, 2 miles from Sandwick.

Records Available.—Daily discharges May 31, 1914, to December 31, 1915. (Records for 1915 are given herein; those for 1914 are tabulated in a previous report.)

Drainage Area.—One hundred and fifty square miles.

Gauge.—Twelve foot enamel staff, 20 feet downstream from bridge, on cribbing, right bank. Gauge read twice daily by Mr. W. Calhoun.

Channel.—Straight for 500 feet above and 300 feet below section. Gravel bed. Stream confined by cribbing, both banks, in high water.

Discharge Measurements.—Four in 1914, and three in 1915.

Winter Flow.—Open all year.

Accuracy.—"B" (up to discharge of 900 cubic feet per second). "C" (above 900 cubic feet per second).

Discharge Measurements of Tsolum River 3 Miles above Mouth for 1915.

Date.	Engineer.	Meter No.	Width.	Area of Section.	Mean Velocity.	Gauge Height.	Discharge.
			Feet.	Sq. ft.	Ft. per sec.	Feet.	Sec.-ft.
April 21	Milner & Webb	1,933	65	131.0	1.40	5.83	181.0[1]
Sept. 26	H. C. Hughes	1,505	11	2.2	0.95	4.65	2.1[2]
Oct. 30	Webb & Balls	1,057	97	212.0	2.63	6.85	558.0

[1] Gauge lowered two feet.
[2] Not at regular section.

REPORT

OF THE

BRITISH COLUMBIA HYDROMETRIC SURVEY FOR 1915.

CHAPTER VII.

Kamloops Division.

HYDROMETRIC DATA.

CHAPTER VII.

KAMLOOPS DIVISION—HYDROMETRIC DATA.

KAMLOOPS DISTRICT.

BARRIERE RIVER.—(2084).

Location.—Below the city of Kamloops power plant, near the mouth of the river, and forty miles from Kamloops; Water District No. 2.

Records Available.—Continuous records have been kept from March 22 to December 31, 1915, which will be available when the station is more completely rated.

Gauge.—Chain gauge read three times a week by A. C. Champion.

Channel.—Water swift.

Discharge Measurements.—Five measurements during 1915, but not well enough distributed to define the rating curve properly.

Discharge Measurements of Barriere River below Power Plant.

Date.	Engineer.	Meter No.	Width.	Area of Section.	Mean Velocity.	Gauge Height.	Discharge.
1915			Feet.	Sq. ft.	Ft. per sec.	Feet.	Sec.-ft.
Mar. 2	Tredcroft & Archibald	1,923	57	56	1.5	.....	83
Mar. 15	E. H. Tredcroft	1,923	54	66	1.6	6.7	104
May 6	E. H. Tredcroft	1,923	85	254	4.7	9.5	1,200
Aug. 14	E. H. Tredcroft	1,923	73	107	2.6	7.5	280
Sept. 1	E. H. Tredcroft	1,923	64	88	2.2	7.0	199

BOLEAN CREEK.—(2002).

Location.—Section 10, township 18, range 12, west 6th meridian.

Records Available.—May 23 to December 31, 1911; January 1 to September 16, 1912; April 27 to September 19, 1913; April 1 to December 8, 1914; April 1 to September 30, 1915.

Drainage Area.—Eighty square miles.

Gauge.—Vertical staff read by Clement Stickney, Falkland, B.C.

Channel.—Gravel and sand, about 20 feet wide, which has shown a tendency to shift.

Discharge Measurements.—Nine measurements taken during 1912-13-14-15 cover all stages, except the peaks of the freshet.

Winter Flow.—Partial ice conditions usually prevail during December and January.

Accuracy.—The changes in the channel give a chance for certain inaccuracies, but otherwise the results should be very good.

Discharge Measurements of Bolean Creek near Mouth.

Campbell Creek.—(2004).

Location.—Section 26, township 19, range 16, west 6th meridian.

Records Available.—May 27 to October 4, 1911; April 1 to September 16, 1912; May 1 to August 31, 1913; April 1 to August 31, 1914; April 1 to September 30, 1915.

Drainage Area.—Two hundred square miles.

Gauge.—Vertical staff gauge read by A. Holt, of Barnhart Vale.

Channel.—Straight for about 100 feet at measuring section. Bed of stream sandy and fairly permanent. Average width of channel about 10 feet.

Discharge Measurements.—Gauge height-discharge curve is very well defined from ten meterings taken during 1914 and 1915.

Winter Flow.—Ice conditions prevail during December, January and February.

Accuracy.—High; results compiled from a well-rated curve.

Cherry Creek.—(2005).

Location.—Section 14, township 19, range 19, west 6th meridian.

Records Available.—June 5 to September 1, 1911; April 24 to September 15, 1912; April 19 to October 19, 1913; May 1 to August 19, 1914; April 1 to September 30, 1915.

Drainage Area.—Sixty-two square miles.

Gauge.—Standard chain gauge installed during 1914 in canyon, and read daily by F. Bowers, during high water, and twice weekly during low water.

Channel.—Straight at measuring section. Velocity swift at all stages. Control is fairly good.

Discharge Measurements.—Eight discharge measurements made during 1914 and 1915 define rating curve very well except for discharges between 20 and 50 cubic feet per second.

Accuracy.—Results should be quite reliable except for the uncertainty in a portion of the rating curve not definitely located by measurements.

Discharge Measurements of Cherry Creek above Bowers Ranch.

Clearwater River.—(2047).

Location.—Near Raft river: Water District No. 2.

Records Available.—August 12 to December 31, 1913; January 1 to December 31, 1914; January 1 to December 31, 1915.

Drainage Area.—Two thousand four hundred square miles.

Gauge.—Standard chain gauge graduated in feet and tenths, and read by Theo. Brookfield, rancher; repaired and datum changed March 13, 1915.

Measuring Section.—Five hundred feet above gauge; width of channel 230 feet. Bed of stream rocky and permanent. Deepest point in measuring section at highest recorded water level 22 feet.

Discharge Measurements.—Measurements are made from car suspended from ¾-inch cable.

Winter Flow.—The Clearwater river is seldom frozen during winter to the extent of materially affecting the accuracy of returns.

Accuracy.—Results should be very reliable except for discharges between 6,000 and 14,000 cubic feet per second, which are subject to a little uncertainty.

Edwards Creek.—(2082).

Location.—Three miles from mouth, in section 26, township 22, range 16, west of the 6th meridian.

Records Available.—June 24 to October 31, 1911; April 20 to September 21, 1912; April 13 to September 30, 1915.

Drainage Area.—Fifteen square miles above gauging station.

Gauge.—Vertical staff read daily by H. Devick.

Channel.—Gravel.

Discharge Measurements.—Two in 1915 and six in 1911 and 1912 agree fairly well and cover all stages.

Accuracy.—Not sufficient measurements in 1915 to warrant a very high accuracy value being assigned. It should be noted that water was being drawn off from Edwards creek, above the gauging station, through Lyon's diversion (station No. 2083), and also 2 cubic feet per second through Devick's diversion, from June 8 to 16, 1915.

Discharge Measurements of Edwards Creek 3 Miles from Mouth.

The period	58	2	6.6	.....	.....	1,990

NOTE.—Water was being diverted from Edwards creek above this station through Lyons diversion from April 13 to August 4 with interruptions. A regular gauging station has been maintained on this diversion (No. 2083). From June 8 to 16, 1915, 2 cubic feet of water per second was diverted through Devick's ditch.

GUICHON CREEK.—(2014).

Location.—Near Mamit lake; Water District No. 3.

Records Available.—June 3 to December 31, 1911; January 1 to November 14, 1912; April 26 to September 29, 1913; April 1 to November 30, 1914; March 1 to September 30, 1915.

Drainage Area.—Three hundred and fifteen square miles.

Gauge.—Standard vertical staff gauge read daily by Miss O. Quenville.

Channel.—Channel is straight at measuring section. Velocities fairly high. Bed of stream composed of sand and gravel, and considered permanent.

Discharge Measurements.—Twenty-six discharge measurements have been taken on this creek during 1911-12-13-14-15. They agree very well and cover all stages.

Winter Flow.—Ice conditions generally prevail on this stream throughout January and February.

Accuracy.—Results should be very reliable at all stages.

Note.—There are a few small irrigation diversions above this station.

Heffley Creek, Below Heffley Lake.—(2019).

Location.—Section 9, township 22, range 16, west 6th meridian.

Records Available.—May 25 to December 8, 1911; April 1 to September 20, 1912; May 11 to September 19, 1913; May 1 to December 9, 1914; April 1 to September 30, 1915.

Drainage Area.—Twenty-eight square miles.

Gauge.—Standard vertical staff gauge read daily by F. S. Lawrence.

Channel.—Straight at measuring section and permanent bed.

Discharge Measurements.—Seven measurements during 1914 and 1915 agree very well and cover the whole range of stage.

Winter Flow.—Ice conditions generally prevail during January and February.

Accuracy.—Results should be quite reliable at all stages.

NOTE.—The flow at this station is regulated by a storage dam on Heffley lake.

HEFFLEY CREEK, ABOVE DIVERSIONS AT MOUTH.—(2018).

Location.—Section 11, township 22, range 17, west 6th meridian.

Records Available.—August 19 to October 31, 1911; April 3 to September 15, 1912; April 13 to September 15, 1913; April 1 to December 6, 1914; March 1 to September 30, 1915.

Drainage Area.—Sixty-five square miles.

Gauge.—Vertical staff gauge read daily by Mrs. J. Austin.

Channel.—About 15 feet wide, with rocky bed.

Discharge Measurements.—Three measurements in 1915, at low stages, and fourteen during 1911-12-13-14. There seems to have been some change in the channel and only the 1915 measurements are used for defining the lower part of the curve.

Accuracy.—Results affected somewhat by changes in channel. The flow is regulated on Heffley lake, and there are diversions in the upper part of the watershed.

Discharge Measurements of Heffley Creek above Diversions at Mouth.

The period	40	1	6			2,560

Note.—The flow is regulated by a storage dam on Heffley lake and there are diversions in the upper part of the watershed.

Ingram Creek.—(2020).

Location.—Section 23, township 17, range 13, west 6th meridian.

Records Available.—April 1 to October 4, 1911; April 1 to August 31, 1912; April 1 to September 16, 1913; May 6 to November 11, 1914; April 1 to September 30, 1915.

Drainage Area.—Twenty-five square miles.

Gauge.—The gauge is a vertical staff gauge read daily by Miss S. King.

Channel.—Rocky, steep gradient and swift water.

Discharge Measurements.—Five measurements made during 1914-15 agree very well and cover the whole range of stage.

Winter Flow.—Ice conditions usually exist during December, January and February.

Accuracy.—The general accuracy of results is considered high for all stages.

Discharge Measurements of Ingram Creek above Diversions.

Jamieson Creek.—(2022).

Location.—Section 21, township 22, range 17, west of the 6th meridian.

Records Available.—June 22 to October 30, 1911; April 3 to October 30, 1912; May 1 to October 1, 1913; January 1 to January 24, and April 1 to December 9, 1914; April 1 to September 30, 1915.

Drainage Area.—Sixty-six square miles.

Gauge.—Vertical staff gauge situated above British Columbia Fruitlands Diversion, and read daily by J. Crack, rancher.

Channel.—Is approximately 30 feet in width, with rocky bed.

Discharge Measurements.—Are made from highway bridge at high water and by wading at low water. Fourteen measurements made during 1911-12-13-14-15 agree very well and cover the whole range of stage.

Accuracy.—Results should be quite reliable for all stages.

September	40	8.0	24	0.36	0.40	1,430
The period	375	0.1	94	1.27	8.64	30,480

Note.—Regulated by a storage dam.

Little Clearwater Creek.—(2056).

Location.—Near Raft river; Water District No. 2.

Records Available.—June 17 to December 31, 1914; January 1 to September 30, 1915.

Drainage Area.—One hundred square miles.

Gauge.—Standard vertical staff gauge set near footbridge, at crossing of Murtle river trail, and read by P. McDougall, rancher.

Channel.—Average width 40 feet. The velocities are low even at high water, seldom exceeding 2.0 feet per second. Bed of stream at measuring section composed of mud and silt.

Discharge Measurements.—Four measurements made during 1914 and 1915 cover practically the whole range of stage, but leave certain intermediate parts somewhat indefinite.

Winter Flow.—Partial ice conditions exist during latter end of January and beginning of February.

Accuracy.—The results are probably quite reliable but, before a very high accuracy value can be assigned, a few more measurements will be needed at intermediate stages.

Louis Creek.—(2023).

Location.—Section 33, township 23, range 15, west 6th meridian.

Records Available.—July 16 to October 31, 1911; April 1 to November 16, 1912; May 1 to October 14, 1913; April 1 to December 11, 1914; April 1 to September 30, 1915.

Drainage Area.—One hundred square miles.

Gauge.—Standard vertical staff gauge read daily by D. G. McKnight.

Channel.—The width of stream averages 25 to 35 feet at measuring section. The section seems to be shifting somewhat.

Discharge Measurements.—Twelve measurements made during 1911-12-13-14-15 seem to indicate a gradual scouring at the control from year to year. The low part of the rating curve used for 1915 is determined from 1915 measurements.

Winter Flow.—Ice conditions obtain on this stream usually throughout January, February and March.

Accuracy.—The accuracy of the results is somewhat impaired by the shifting channel.

Lyons Diversion From Edwards Creek. (2083).

Location.—Near Edwards creek, in section 34, township 22, range 16, west of 6th meridian.

Records Available.—April 13 to September 30, 1915.

Gauge.—Vertical staff read by H. Devick.

Discharge Measurements.—Two in 1915.

Accuracy.—Results quite reliable except for discharges above 1.0 cubic foot per second.

MONTE CREEK, BELOW DIVERSION TO SUMMIT LAKE.—(2025).

Location.—Section 22, township 18, range 14, west 6th meridian.

Records Available.—May 25 to September 30, 1911; April 1 to September 17, 1912; June 20 to September 30, 1913; April 1 to November 17, 1914; April 1 to September 30, 1915.

Drainage Area.—Forty-five square miles.

Gauge.—Standard vertical staff gauge read daily by E. C. Lewis.

Channel.—Width of channel averages 10 feet. Bed of stream gravelly and permanent.

Discharge Measurements.—Fourteen measurements made during 1912-13-14-15 indicate a shift in the channel. Only the 1915 measurements have been used to locate the lower part of the rating curve.

Winter Flow.—Ice conditions generally prevail throughout winter months.

Accuracy.—There is a certain amount of indefiniteness about the location of the rating curve between discharges of 20 and 60 cubic feet per second. The curve is quite indefinite above 80 cubic feet per second also, but the discharge only exceeded that amount for two days.

Discharge Measurements of Monte Creek below Diversion to Summit Lake.

Monte Creek, Above Bostock's Diversion.—(2024).

Location.—Section 25, township 19, range 15, west 6th meridian.

Records Available.—May 20 to June 30, 1911; August 8, 1911; April 8 to September 7, 1912; April 16 to September 13, 1913; April 1 to December 4, 1914; April 7 to September 30, 1915.

Drainage Area.—One hundred and ten square miles.

Gauge.—Standard vertical staff gauge read semi-weekly by T. F. Teagle.

Channel.—About 15 feet wide, with rocky bed.

Discharge Measurements.—Seventeen measurements made during 1911-12-13-14-15 agree fairly well and cover the whole range of stage.

Winter Flow.—Ice conditions prevail during December, January and February.

Accuracy.—Gauge readings are only taken twice a week, which tends to lessen the accuracy of the results.

Discharge Measurements of Monte Creek above Bostock's Diversion.

Monthly Discharge of Monte Creek above Bostock's Diversion for 1915.

(Drainage area, 110 square miles.)

Month.	Discharge in Second-Feet.				Run-Off	
	Maximum.	Minimum.	Mean.	Per square mile.	Depth in inches on Drainage area	Total in acre-feet
April	10.9	2.8	5.3			320
May	21.0	8.1	13.0			800
June	39.0	6.2	10.2			610
July	16.1	3.1	6.6			410
August	2.8	0.8	1.7			100
September	1.8	0.2	0.9			50
The period	39.0	0.2	6.3			2,290

NOTE.—There are other diversions in the upper part of the watershed.

Murtle River.—(2069).

Location.—At the Clearwater trail crossing, 15 miles below Murtle lake and about 50 miles by trail from the Canadian Northern Railway, at Raft River. post office. A 50-mile trip by pack trail is necessary after leaving the railway

Records Available.—Gauge readings have been taken since September 1914, which will be available when the station is completely rated.

Drainage Area.—Only part of the watershed of the Murtle river has been surveyed, and there is hardly enough data available to make a close estimate of the drainage area.

Gauge.—A Gurley Automatic Water Stage Register was installed in November 1915. This gauge prints the stage to the nearest hundredth of a foot every 15 minutes. Before November, a chain gauge was in use, read four times a week by P. McDougall.

Channel.—The bed of the stream is composed of rocks and gravel and is very smooth and even. The water is quite swift.

Discharge Measurements.—Three measurements have been made during 1914 and 1915 which locate the rating curve for low stages. A cable car was erected in May 1915 and it will now be possible to get high water measurements.

Accuracy.—The results computed should be fairly accurate. In future, with an automatic gauge and a cable car, it should be possible to get very precise results.

Discharge Measurements of Murtle River 20 Miles above Helmcken Falls.

NOTE. Station not completely rated this season.

North Thompson River.—(2085).

Location.—Forty miles north of Kamloops and one mile above the mouth of Barriere river: Provincial Water District No. 2.

Records Available.—June 1 to December 31, 1915.

Drainage Area.—Above gauging station, about 7,000 square miles. Above mouth, about 7,400 square miles.

Gauge.—Chain gauge on highway bridge read daily by A. C. Champion.

Channel.—Stream confined by bridge abutments, velocity moderate at all stages.

Discharge Measurements.—Made from highway bridge. Five measurements have been made during 1915 and the winter months of 1916, and the discharge curve is well defined between gauge heights 2.0 and 5.0 and between 10.0 and 11.0. At other stages the curve is not so well defined and the figures for the discharge less accurate.

The period	28,800	3,000	13,388	1.91	15.21	5,695,910

Paul Creek.—(2032).

Location.—Section 31, township 20, range 16, west 6th meridian.

Records Available.—July 1 to October 6, 1911; May 12 to September 25, 1912; May 18 to September 30, 1913; April 20 to September 27, 1914; April 25 to September 30, 1915.

Drainage Area.—Sixty-five square miles.

Gauge.—Vertical staff gauge read weekly by E. L. Ridout.

Channel.—Channel is rocky, and current is very swift at high stages.

Discharge Measurements.—The gauge height curve is fairly well defined except at very low stages (below 10 cubic feet per second discharge). The flow is artificially controlled by a dam on Paul lake.

Winter Flow.—Stream usually dries up during winter, or ice conditions obtain.

Accuracy.—Some uncertainty in regard to low water discharges; gauge readings only once a week.

Discharge Measurements of Paul Creek below Paul Lake.

Monthly Discharge of Paul Creek below Paul Lake for 1915.

(Drainage area, 65 square miles.)

Month.	Discharge in Second-Feet.				Run-Off.	
	Maximum.	Minimum.	Mean.	Per square mile.	Depth in inches on Drainage area.	Total in acre-feet.
May	36	15	27.6	0.40	0.56	1,700
June	40	7	15.5	0.24	0.27	920
July	36	14	25.5	0.39	0.45	1,570
August	14	5	11.5	0.18	0.21	710
September	11	4	5.6	0.09	0.10	330
The period	36	4	17.1	0.26	1.49	5,230

Note.—The flow in Paul creek is regulated by the storage dam on Paul lake.

Raft River.—(2055).

Location.—Raft river; Water District No. 2.

Records Available.—June 1, 1914, to December 14, 1914; February 21 to December 31, 1915.

Drainage Area.—Three hundred square miles.

Gauge.—Standard chain gauge on highway bridge, graduated in feet and tenths, having a range from 3.0 to 9.0 and read by J. McLennan, Raft River P.O.

Channel.—Average width of channel 150 feet. Bed of stream composed of rock, sand and gravel, and permanent.

Discharge Measurements.—Six measurements made during 1914 and 1915 agree very closely and cover practically the entire range of stage for 1915.

Winter Flow.—Ice conditions obtain on this river during the latter part of December, throughout January, and during the first half of February.

Accuracy.—The results for 1915 should be quite reliable at all stages except for discharges below 40 cubic feet per second.

Salmon River.—(2078).

Location.—Below the mouth of Bolean creek, section 2, township 18, range 12, west of the 6th meridian.

Records Available.—May 23 to December 31, 1911; January 1 to September 13, 1912; April 1 to September 30, 1915.

Drainage Area.—Three hundred and fifty square miles.

Gauge.—Vertical staff read daily by M. White.

Channel.—Stream confined between bridge abutments; water fairly swift.

Discharge Measurements.—Thirteen measurements made during 1911-12-13 and -15 agree fairly well and cover the whole range of stage.

Winter Flow.—Usually open water conditions obtained all winter.

Accuracy.—The results depend mainly on measurements made in previous years. The two made during 1915 agree fairly well with the old ones.

Siwash Creek.—(2058).

Location.—Section 12, township 22, range 16, west 6th meridian.

Records Available.—June 7 to July 28, 1914; April 1 to September 30, 1915. (Records for 1915 are given herein; preceding records are tabulated in a previous report.)

Drainage Area.—Seven square miles.

Gauge.—Standard vertical staff gauge installed above Cippoletti weir and read daily by J. S. Wardell.

Channel.—Straight above weir. Velocity, medium.

Discharge Measurements.—Weir formula used for calculating discharges. Two meter measurements made during 1915 agree fairly well with the weir results.

Winter Flow.—Stream usually runs dry in the fall.

Accuracy.—Accuracy of results compiled from weir discharge table should be quite high.

Discharge Measurements of Siwash Creek near Heffley Lake.

Three Mile Creek.—(2080).

Location.—Section 23, township 20, range 21, west 6th meridian: Water District No. 2.

Records Available.—Gauge readings from June 21 to September 30, 1915.

Drainage Area.—Fifty-five square miles.

Gauge.—Standard 3-foot staff read daily by L. Harris.

Channel.—Gravel and large stones; fairly permanent; water generally less than one foot deep.

Discharge Measurements.—Three measurements made during 1915 only cover part of the range of stage. High and low water measurements required.

Accuracy.—Discharges between 3 and 8 cubic feet per second are probably quite reliable.

TRANQUILLE RIVER.—(2043).

Location.—Section 36, township 20, range 19, west 6th meridian.

Records Available.—July 4 to October 21, 1911; March 29 to September 7, 1912; May 1 to October 31, 1913; May 3 to November 14, 1914; April 1 to September 30, 1915.

Drainage Area.—Two hundred and thirty square miles.

Gauge.—Standard vertical staff read daily by Eug. Cooney.

Channel.—Straight at the gauge section, about 20 feet wide. Bed of stream composed of stone and boulders and control is good.

Discharge Measurements.—Gauge height discharge curve was well defined for 1914 and assumed unchanged for 1915.

Winter Flow.—Ice conditions prevail during December, January and February.

Accuracy.—No measurements during 1915. Section apparently remained unchanged from 1911 to 1914 and it is assumed it did not change during 1915.

Whitewood Creek.—(2066).

Location.—Twenty-five miles north of Kamloops, on the west bank of the North Thompson river; Water District No. 2.

Records Available.—September 1 to December 12, 1914; March 10 to September 30, 1915.

Drainage Area.—Twenty-five square miles.

Gauge.—Vertical staff read daily by G. Mayson.

Channel.—Rocky; water fairly swift.

Discharge Measurements.—Three measurements made during 1914 and 1915 define the lower part of the curve up to a discharge of 9 cubic feet per second.

Accuracy.—Discharges above 9 cubic feet per second are subject to considerable uncertainty.

Discharge Measurements of Whitewood Creek 2 Miles from Mouth.

OKANAGAN DISTRICT.

ADAMS RIVER.—(2000).

Location.—Section 6, township 23, range 12, west 6th meridian.

Records Available.—July and August 1911; and continuous records since January 1, 1912.

Drainage Area.—One thousand six hundred square miles.

Gauge.—Gurley Automatic Gauge installed October 17, 1914, to replace vertical staff gauge previously in use. The frequent changes of the gates in the dam at the outlet of the lake made it difficult to get reliable results without an automatic gauge.

Channel.—The meter measurements are made just above the dam where the channel is suitable; width from 300 to 500 feet, with velocity less than 3.0 feet per second. The gauge is located below the dam with a permanent natural control and swift water.

Discharge Measurements.—Twelve meter measurements taken during 1911, -13-14-15, well distributed over the whole range of stage except for discharges above 6000 cubic feet per second.

Winter Flow.—Even in very cold weather the river does not seem to freeze over at the gauge, nor does the water freeze in the gauge well, so that open water conditions obtain all winter.

Accuracy.—With a rating curve very well defined except for very high discharges and an automatic gauge recording the stage to the nearest hundredth of a foot every fifteen minutes, the records should be exceptionally accurate. The recorded flow, however, is not the natural flow of the stream, as it is regulated by the storage dam at the outlet of the lake.

June	5,380	2,480	4,100	2.56	2.86	244,000
July	7,270	3,260	5,006	3.13	3.61	308,000
August	3,180	2,610	2,723	1.70	1.96	167,000
September	3,340	750	1,774	1.11	1.24	105,500
October	1,230	750	807	0.50	0.58	49,600
November	1,536	860	1,051	0.66	0.74	62,500
December	1,690	675	1,027	0.64	0.74	63,100
The period	7,270	260	2,009	1.25	17.16	1,463,500

Note.—The run-off from Adams lake is regulated by a storage dam and the water is used for running logs down the river.

Boundary Creek.—(2048).

Location.—At Greenwood: Water District No. 4.

Records Available.—January 1 to December 7, 1914; February 21 to December 22, 1915.

Drainage Area.—One hundred and twenty-five square miles.

Gauge.—Vertical staff gauge graduated in feet and tenths, situated on upstream side of traffic bridge, read daily by P. A. McCarrach.

Channel.—Channel is straight for about 300 feet above and below measuring section. Bed of stream is rocky and permanent.

Discharge Measurements.—Six discharge measurements made during 1914 and 1915 show very good agreement and define the rating curve very well except for discharges between 100 and 250 and above 400 cubic feet per second.

Winter Flow.—Ice conditions exist during January and February.

Accuracy.—Except for the higher stages during the freshet, the results should be very accurate.

The period	600	9	126	1.01	10.27	68,620

Brash Creek.—(2070).

Location.—Section 27, township 18, range 8, west 6th meridian; Water District No. 2; above the intake of the Enderby waterworks system.

Records Available.—Regular records from October 28 to December 31, 1915; two meter measurements in April and September, 1915.

Drainage Area.—Ten square miles.

Gauge.—Standard vertical staff read twice a week by F. H. Hawes, for the city of Enderby.

Channel.—Boulders and gravel, water swift at high stages, control should be permanent.

Discharge Measurements.—Three measurements in 1915 are sufficient to locate the rating curve for the small range of stage during November and December.

Winter Flow.—Ice conditions exist during the three winter months.

Accuracy.—The results obtained for the last two months of the year should be quite reliable. The gauge is only read twice a week, but there were no marked fluctuations.

Co-operation.—Gauge readings are supplied by the city of Enderby.

The period	4.4	1.8	3.0	0.30	0.68	360

CHASE CREEK.—(2073).

Location.—Section 25, township 21, range 13, west of the 6th meridian; Water District No. 2.

Records Available.—June 1 to November 9, 1911; March 1 to December 7, 1912; May 9 to September 30, 1915.

Drainage Area.—One hundred and twenty square miles.

Gauge.—Vertical staff read daily by Geo. Keilty.

Channel.—There were some obstructions in the channel which interfered with a free flow of the stream, particularly at high water. These were removed on June 5, causing a change in the rating. Conditions have been stable ever since.

Discharge Measurements.—Three measurements were obtained to define the rating curve for high stages previous to June 5, and five measurements for the lower stages occurring after the change.

Winter Flow.—Ice conditions obtain during the three winter months.

Accuracy.—The results obtained before June 5 are subject to some uncertainty; after that date, they should be quite reliable except for discharges above 100 cubic feet per second.

Crazy Creek.—(2051).

Location.—Section 28, township 23, range 5, west of the 6th meridian.

Drainage Area.—Forty-five square miles.

Records Available.—March 8 to December 13, 1914; March 24 to December 31, 1915.

Gauge.—Standard vertical staff situated on C.P.R. siding bridge.

Channel.—The channel averages about 75 feet in width. Bed of stream is rocky, and velocities are high.

Winter Flow.—Ice conditions exist on this stream during November, December, January and February.

Discharge Measurements.—Five measurements made during 1913-14-15 agree fairly well and cover the whole range of stage.

Accuracy.—Results should be quite reliable at all stages.

Eagle River at Malakwa.—(2010).

Location.—Section 9, township 23, range 6, west 6th meridian.

Records Available.—May 14 to December 31, 1913; January 8 to December 12, 1914; February 7 to December 31, 1915.

Drainage Area.—Four hundred and twenty square miles.

Gauge.—Standard chain gauge situated on highway bridge and read daily by P. C. Cold.

Channel.—The channel is uniform and straight for 100 yards above and below the gauge.

Discharge Measurements.—Are made from upstream side of highway bridge. Velocities are uniform and not too high. Measurements made during 1913-14-15 agree very well and cover the whole range of stage.

Winter Flow.—Partial ice conditions exist on the river during January and February.

Accuracy.—The results are considered to be very reliable at all stages.

Granite Creek.—(2064).

Location.—Near Coalmont; Water District No. 4.

Records Available.—June 19 to December 31, 1914; April 1 to September 30, 1915.

Drainage Area.—Forty square miles.

Gauge.—Standard vertical staff gauge graduated in feet and tenths, situated on footbridge. Read daily by Miss Emily Cook.

Channel.—Channel is straight for 100 feet above and 500 feet below measuring section. Velocity high. Bed of stream is composed of gravel and rock, considered permanent.

Discharge Measurements.—Six measurements made during 1914 and 1915 agree very well and cover practically all stages.

Accuracy.—Results should be quite reliable at all stages.

KETTLE RIVER, NORTH FORK.—(2052).

Location.—At Grand Forks; Water District No. 5.

Records Available.—June 1 to December 31, 1914; January 1 to December 31, 1915.

Drainage Area.—Six hundred and forty square miles.

Gauge.—Standard vertical staff gauge situated on footbridge, graduated in feet and tenths, and read daily by Geo. O'Keefe.

Channel.—Channel is straight for 100 yards above and below measuring section. Velocity high.

Discharge Measurements.—Six discharge measurements made during 1914 and 1915 cover all stages up to 5,000 cubic feet per second.

Accuracy.—During the early spring a pile of slag interfered somewhat with the accuracy of the results, but a correction was made to allow for this condition.

Kettle River, West Fork.—(2045).

Location.—Near Westbridge; Water District No. 5.

Records Available.—February 23 to September 30, 1914; January 1 to February 6 and March 29 to December 31, 1915.

Drainage Area.—Six hundred and ninety square miles.

Gauge.—Standard vertical staff gauge, graduated in feet and tenths, read daily by R. Demazes.

Channel.—Channel is straight for 500 feet above and below measuring section. Bed composed of gravel and boulders.

Discharge Measurements.—Five measurements made during 1914 and 1915 agree very well and cover all stages to a discharge of 1,300 cubic feet per second.

Winter Flow.—Partial ice conditions prevailed during February and March.

Kettle River, near Nicholson's Bridge.—(2046).

Location.—Near Kettle Valley Water; District No. 5.

Records Available.—March 1 to December 11, 1914; February 18 to November 30, 1915.

Drainage Area.—Two thousand one hundred and eighty square miles.

Gauge.—Standard vertical staff gauge, graduated in feet and tenths, situated on pier of highway bridge, and read daily by N. Whiting, rancher.

Channel.—Average width, 150 feet; bed of stream gravel and sand, and considered permanent. Velocity high; control good.

Discharge Measurements.—Six measurements made during 1914 and 1915 agree very well and cover all ranges of stage up to 7,000 cubic feet per second.

Winter Flow.—Ice conditions exist during January, February and December.

Accuracy.—Results should be quite reliable at all stages.

November	430	330	381	0.17	0.19	22,700
The period	8,080	165	1,662	0.76	7.79	907,000

Kettle River, at Carson.—(2049).

Location.—At Carson; Water District No. 5.

Records Available.—September 5 to December 31, 1913; January 1 to 22, February 25 to December 9, 1914; March 1 to November 30, 1915.

Drainage Area.—Three thousand and ten square miles.

Gauge.—Chain gauge on highway bridge, 4 miles from Grand Forks.

Channel.—Straight at measuring section; bed of stream, gravel and sand; control good.

Discharge Measurements.—Measurements are made from highway bridge. Six measurements made during 1914 and 1915 agree very well and cover the whole range up to 8,000 cubic feet per second.

Winter Flow.—Partial ice conditions prevail during December, January and February.

Accuracy.—Accuracy is considered good, and results should fall within 10 per cent.

Discharge Measurements of Kettle River at Carson.

Manson Creek.—(2074).

Location.—Section 14, township 23, range 10, west 6th meridian.

Records Available.—April 26 to September 30, 1915.

Drainage Area.—Twenty-four square miles.

Gauge.—Vertical staff read daily by H. Noakes.

Channel.—Rocks and gravel; current swift at high water.

Discharge Measurements.—Four measurements were taken during 1915. The two highest ones do not agree very well and are much below the highest stage for the season.

Winter Flow.—This stream is used for irrigation only, and no attempt is made to keep up the records during the winter.

Accuracy.—Rather poor except at low water. The stream is not considered of very great importance.

Discharge Measurements of Manson Creek 1 Mile from Mouth.

Niskonlith Creek.—(2031).

Location.—Section 5, township 21, range 13, west 6th meridian.

Records Available.—September 1 to December 31, 1911; April 1 to September 13, 1912; May 1 to September 30, 1913; April 1 to December 11, 1914; April 1 to September 30, 1915.

Drainage Area.—Fifty square miles.

Gauge.—Vertical staff gauge read semi-weekly by H. Hoffman.

Channel.—The stream bed is composed of large rocks and boulders.

Discharge Measurements.—Seven measurements made during 1911-12 and 1915 agree very well and cover all ranges of stage for 1915.

Accuracy.—Except for the fact that the gauge readings are not taken every day, the results should be quite reliable. However, there are diversions above the station which affect the flow for part of the irrigation season.

Winter Flow.—Ice conditions prevail during last half of December, January, February and March.

NOTE.—Artificial storage and diversions above station.

OKANAGAN RIVER, AT OKANAGAN FALLS.—(2088).

Location.—Three hundred feet above Okanagan Falls; Water District No. 4.

Records Available.—April 8 to December 31, 1914; at original station near Fairview; January 1 to December 31, 1915, at Okanagan Falls.

Gauge.—The gauging station was transferred on March 17, 1915, from its original location near Fairview to its present position above Okanagan Falls, on account of the shifting channel at the old station. Gauge readings for 1915, prior to the change, have been transferred to the new station. A standard vertical staff gauge six feet long has been installed and is read four or five times a week by A. S. Hatfield, stage driver.

Channel.—The bed of the stream at the gauge is composed of clean gravel and the current is moderately slow at all stages. An excellent control is formed by the brink of the falls.

Discharge Measurements.—Four meter measurements have been taken during 1915 and they cover the entire range of stage except between discharges of 500 and 1,000 cubic feet per second.

Winter Flow.—Open water conditions obtained all year round during 1915.

Accuracy.—The results should be quite reliable and within the limits of error indicated for the various months.

Ross Creek.—(2077).

Location.—Two miles from mouth; section 20, township 23, range 9, west 6th meridian.

Records Available.—April 27 to September 30, 1915.

Drainage Area.—Fifty-six square miles.

Gauge.—Vertical staff read daily by Jas. Tetlow.

Channel.—Rocks and gravel, deep pool at the gauge.

Discharge Measurements.—Four measurements made during 1915 define the rating curve between discharges of 180 and 240 and also at 7 cubic feet per second.

Accuracy.—"C" (on account of insufficient measurements at certain stages). This stream is not considered very important.

Discharge Measurements of Ross Creek 2 Miles from Mouth.

Scotch Creek.—(2079).

Location.—Three miles from mouth; section 3, township 23, range 11, west 6th meridian; Water District No. 2.

Records Available.—April 27 to December 31, 1915.

Drainage Area.—Two hundred and forty-five square miles.

Gauge.—Standard vertical staff read three times a week by A. Stegel.

Channel.—Small boulders, current swift.

Discharge Measurements.—Five measurements made during 1915 define the rating curve for discharges between 800 and 1,300 and also for 100 cubic feet per second.

Winter Flow.—Ice conditions during winter months.

Accuracy.—"C" (on account of insufficient measurements at certain stages). This stream is not considered very important.

Seymour River.—(2061).

Location.—Near the head of Seymour Arm; Water District No. 2.

Records Available.—August 17 to December 11, 1914; March 8 to December 31, 1915.

Drainage Area.—Two hundred and fifty square miles.

Gauge.—Chain gauge suspended over river on a substantial pole; read daily during freshet period and three times a week during the rest of the season. F. G. Bergen, gauge reader.

Channel.—Rocks and gravel; water swift.

Discharge Measurements.—Made from cable car installed May 1, 1915; previous measurements from boat. Nine measurements during 1914 and 1915 agree very well and cover practically all stages except for discharge above 2,200 cubic feet per second.

Winter Flow.—Ice conditions obtain during the three winter months.

Accuracy.—"C." There was some trouble with the chain gauge; discharges above 2,200 cubic feet per second are somewhat uncertain.

Shuswap River, at Enderby.—(2034).

Location.—Section 26, township 18, range 9, west of 6th meridian.

Records Available.—August 25 to November 10, 1911; March 1 to December 31, 1912; April 1 to December 31, 1913; January 1 to December 31, 1914; January 1 to December 31, 1915.

Drainage Area.—One thousand six hundred and fifty square miles.

Gauge.—A standard vertical staff gauge situated on highway bridge, and read daily by D. Mowat.

Channel.—The channel is straight for 100 yards at section. The rise and fall of the river each year is about 10 feet. Control is good.

Winter Conditions.—During 1915 the river remained open throughout the winter except for a few days in January, February and December.

Discharge Measurements.—Thirteen well-distributed measurements have been obtained during 1911-12-13 and -15. Measurements were made from boat except during high water, when they were made from bridge.

Accuracy.—"A" and "B." The returns are considered to be quite accurate for practically all stages.

Similkameen River.—(2054).

Location.—Near Ashnola; Water District No. 4.

Records Available.—April 8 to December 31, 1914; January 1 to December 31, 1915.

Drainage Area.—Two thousand three hundred and twenty square miles.

Gauge.—Standard vertical staff gauge read by Harry Atherton, of Keremeos.

Channel.—Average width of channel at measuring section is about 210 feet. Channel is straight at the station. Bed of stream is very rocky and water turbulent even at low stages.

Discharge Measurements.—The gauge height discharge curve is very well rated by well-distributed meterings, except for very low stages (below 350 cubic feet per second).

Winter Flow.—Open water conditions obtained all winter during 1915, which was milder than usual.

Accuracy.—"B" and "C." Results should be quite reliable at practically all stages.

Discharge Measurements of Similkameen River at Ashnola.

South Similkameen River.—(2063).

Location.—At Princeton; Water District No. 4.

Records Available.—May 14 to December 19, 1914; March 22 to November 30, 1915.

Drainage Area.—Four hundred and forty square miles.

Gauge.—Standard chain gauge situated on the highway bridgehead, by J. J. Priest, of Princeton.

Channel.—Average width of channel at measuring section is about 170 feet. Bed of stream is of gravel, with a few boulders, and not liable to shift.

Discharge Measurements.—Made with cable and 30-pound weight. The gauge height discharge curve is very well rated by well-distributed meterings.

Winter Flow.—Ice conditions existed during January, February and December.

Accuracy.—"A" and "B." Results should be quite reliable at all stages.

SOUTH THOMPSON RIVER, AT CHASE.—(2042).

Location.—Section 35, township 21, range 13, west 6th meridian.

Records Available.—April 22 to July 31, 1911; April 10 to December 31, 1912; April 12 to December 31, 1913; January 1 to 27, March 24 to December 31, 1914; January 1 to December 31, 1915.

Drainage Area.—Seven thousand square miles.

Gauge.—A vertical staff gauge is read daily by Mr. W. H. Spencer of the Adams River Lumber Company, Chase, B.C.

Channel.—Above the measuring section river broadens out into Little Shuswap lake. Below section, river is straight for 200 yards.

Discharge Measurements.—Twenty well-distributed measurements have been made during 1911-12-13-14-15. Measurements are made from cable and boat.

Winter Conditions.—The Thompson, at Chase, remains partially open throughout the year except during severe winters.

Accuracy.—"A." The accuracy of returns is considered to be very high for all stages.

TULAMEEN RIVER.—(2062).

Location.—At Coalmont; Water District No. 4.

Records Available.—May 15 to October 3, 1914; April 11 to December 31, 1915.

Drainage Area.—Four hundred square miles.

Gauge.—Chain gauge. Brass jack chain and 3-pound sash weight on downstream side of bridge at measuring section, read by J. J. Currie.

Channel.—Straight for about 700 feet at measuring section. Bed of stream of clean gravel and permanent. Average width about 100 feet.

Discharge Measurements.—Eight discharge measurements made during 1914 and 1915 agree very well indeed and cover all stages.

Winter Flow.—No winter records have been made. Ice conditions prevail on this river during the latter part of December, January and February.

Accuracy.—"B." Results should be fairly reliable. The only disturbing element was some trouble with the chain gauge.

Tulameen river. Gauging station at highway bridge.

Discharge Measurements of Tulameen River at Coalmont.

Twentymile Creek.—(2081).

Location.—Above diversion to the Nickel Plate gold mine power house and four miles from Hedley; Water District No. 4.

Records Available.—April 20 to September 30, 1915; also a few meter measurements in 1913 and 1914.

Drainage Area.—One hundred and twenty square miles.

Gauge.—Standard staff gauge read three times a week.

Channel.—Gravel and boulders; permanent control.

Discharge Measurements.—Six measurements made during 1913-14-15 agree very well and cover the whole range of stage fairly well except for discharges above 250 cubic feet per second.

Winter Flow.—Ice conditions during the winter months.

Accuracy.—"C" and "D." Gauge readings only every other day; no measurements above 250 nor between 50 and 130 cubic feet per second.

Discharge Measurements of Twentymile Creek above Intake.

ASHCROFT DISTRICT.

BARNES CREEK.—(2001).

Location.—Section 23, township 20, range 24, west 6th meridian.

Records Available.—April 26 to September 14, 1912; May 1 to December 14, 1913; April 1 to December 8, 1914; April 1 to September 30, 1915.

Drainage Area.—Thirty-eight square miles.

Gauge.—Standard vertical staff gauge, graduated in feet and tenths, and read daily by G. Crossley.

Channel.—Channel straight at measuring section. Velocity medium. Bed of stream permanent.

Discharge Measurements.—Seven measurements made during 1913-14-15 cover all stages but the peak of the freshet, and agree fairly well.

Winter Flow.—Ice conditions prevail on this stream during January, February and March.

Accuracy.—"C" and "D." Fairly good except for discharges above 50 cubic feet per second.

Beaver Creek.—(2069).

Location.—Five miles above Nicola lake; Water District No. 3.

Records Available.—June 12 to September 30, 1915; station only partly rated as yet.

Drainage Area.—Eighty-three square miles.

Gauge.—Standard vertical staff read daily by D. Anderson.

Channel.—Rocks and gravel, water swift at high stages, control should be permanent.

Discharge Measurements.—Three measurements made during 1915 do not cover the higher stages (above 21 cubic feet per second), and no attempt has been made to complete these for this report. After another year's field work it should be possible to make use of these higher gauge readings if there is no shift in the channel.

Winter Flow.—Ice conditions exist during the three winter months.

Accuracy.—"B." The discharges which have been completed should be fairly reliable.

Bonaparte River.—(2003).

Location.—Section 18, township 21, range 24, west 6th meridian.

Records Available.—June 10 to November 6, 1911; March 25 to December 22, 1912; March 30 to December 31, 1913; January 1 to December 9, 1914; February 20 to December 25, 1915.

Drainage Area.—Two thousand square miles.

Gauge.—Standard vertical staff gauge read daily by H. Collins.

Channel.—Channel straight at measuring section, average width 50 feet. Velocity high.

Discharge Measurements.—Twelve measurements made in 1913-14-15 show fair agreement and cover all stages.

Winter Flow.—Ice conditions prevail on this stream during January and February.

Accuracy.—"B" and "C." Daily gauge readings and a well defined curve should give reliable results.

The period	910	90	274	0.14	1.41	149,770

Cache Creek.—(2071).

Location.—Section 34, township 21, range 24, west of 6th meridian; Water District No. 2. This station is above all diversions except the one to Eightmile creek, on which a regular gauging station has been established (No. 2072).

Records Available.—June 9 to September 24, 1911; April 1 to September 3, 1912; May 9 to September 30, 1915.

Drainage Area.—Thirty-five square miles, but part of the run-off is diverted to Eightmile creek.

Gauge.—Standard vertical staff gauge, read twice a week by A. C. Trimble.

Channel.—Rocks and gravel; current swift.

Discharge Measurements.—Fourteen measurements made during 1912-13 and -15 agree fairly well and cover the whole range of stage except below discharge of 2 cubic feet per second.

Winter Flow.—Ice conditions obtain during the three winter months, but as the stream is only used for irrigation it is not necessary to keep up the records during the winter.

Accuracy.—"B" and "C." Gauge readings are only taken twice a week; the rating curve is subject to a certain indefiniteness at very low stages (below 2 cubic feet per second).

Discharge Measurements of Cache Creek below McAbee's Diversion.

Monthly Discharge of Cache Creek below Diversion to Eightmile Creek for 1915.

(Drainage area, 35 square miles.)

Month.	Discharge in Second-Feet.				Run-Off.	
	Maximum.	Minimum.	Mean.	Per square mile.	Depth in inches on Drainage area.	Total in acre-feet.
June	27	10	16.1	.....	.....	960
July	23	14	17.9	.....	.....	1,100
August	13	1	7.9	.....	.....	490
September	2	0	0.6	.....	.....	40
The period	27	0	10.6	.....	.....	2,600

NOTE.—The discharge through the diversion from the North fork of Cache creek to Eightmile creek must be added to the discharge at the station on Cache creek to give the total run off from the Cache creek watershed.

DIVERSION FROM CACHE CREEK TO EIGHTMILE CREEK.—(2072).

Location.—Section 12, township 22, range 24, west 6th meridian; Water District No. 2. This diversion takes water from the Cache creek above the regular gauging station (2071).

Records Available.—May 21 to July 8, 1915.

Gauge.—Vertical staff in flume is read twice a week, while the diversion is in operation, by A. C. Trimble.

Channel.—Measurements are made in a lumber flume, 2.8 feet wide.

Discharge Measurements.—On June 1, 1915, three measurements were made at high, low and intermediate stages. The flow desired was obtained by means of the headgate at the intake.

Winter Flow.—This diversion is only in use during the spring freshet.

Accuracy.—The results obtained should be quite reliable.

COLDWATER RIVER.—(2006).

Location.—At Merritt; Water District No. 3.

Records Available.—April 17 to August 31, 1913; April 1 to December 6, 1914; March 17 to December 31, 1915.

Drainage Area.—Three hundred and sixty square miles.

Gauge.—Vertical staff gauge read daily by J. Skimming.

Channel.—The stream is from 50 to 75 feet wide; velocities are medium. Bed of stream is rocky and permanent.

Discharge Measurements.—Made by wading during low water, and from traffic bridge at high water. Seven measurements made during 1914 and 1915 show a good agreement and cover all stages except between 700 and 1,400 cubic feet per second.

Winter Flow.—Ice conditions exist on this river during January and February.

Accuracy.—"B" and "C." Results should be quite accurate except for certain indefiniteness in the location of the rating curve mentioned above.

Discharge Measurements of Coldwater River at Merritt.

Criss Creek.—(2007).

Location.—Section 32, township 22, range 22, west 6th meridian.

Records Available.—June 14 to September 14, 1912; April 22 to November 21, 1913; April 1 to December 9, 1914; March 22 to September 30, 1915.

Drainage Area.—One hundred and fifty square miles.

Gauge.—Standard vertical staff gauge read daily by W. H. Hoey.

Channel.—The channel at measuring section is straight. Velocity is high. Bed of stream composed of gravel and boulders.

Discharge Measurements.—Thirteen measurements made during 1912-13-14-15 agree very well and cover all stages up to a discharge of 450 cubic feet per second.

Winter Flow.—Ice conditions exist on this stream during January, February and part of March.

Accuracy.—"B", "C" and "D." Results very reliable except for flood stages.

The period	730	3	73.2	0.24	1.66	26,761

Note.—Regulated by storage dam on Deadman lake.

Hat Creek, above Hammond's Diversion.—(2016).

Location.—Section 18, township 19, range 26, west 6th meridian. At Colley's ranch, just above the Hammond diversion.

Records Available.—April 22, 1911, to December 31, 1911; January 1, 1912; to November 18, 1912; April 30 to December 31, 1913; April 1 to November 30, 1914; March 13 to September 30, 1915.

Drainage Area.—Forty-seven square miles.

Gauge.—Standard vertical gauge read daily by Thos. King.

Channel.—The channel is 12 to 14 feet in width and is straight above and below the gauge; the control is good.

Discharge Measurements.—Well-distributed meterings have been obtained covering the stream's range. Meterings were mostly made in the box flume above the Hammond diversion weir.

Winter Flow.—Stream is sometimes open during winter months.

Accuracy.—"A" and "B." Results should be very reliable at all stages.

Discharge Measurements of Hat Creek above Hammond's Diversion.

Nahatlatch River, Seven Miles from Mouth.—(2027).

Location.—Section 7, township 12, range 26, west 6th meridian.

Records Available.—March 1 to December 7, 1912; January 1 to December 31, 1913; January 1 to December 31, 1914; January 1 to December 31, 1915.

Drainage Area.—Four hundred square miles.

Gauge.—Standard vertical staff gauge read weekly by Chas. Nicholson.

Channel.—Channel at section is straight, with an average depth at low water of 8 feet. Bed of river rocky and permanent.

Discharge Measurements.—Discharge measurements are made from cable car. Six measurements made during 1912-13-14 agree very well and cover the whole range of stage.

Winter Flow.—Open conditions prevailed throughout the winter.

Accuracy.—Results are quite reliable except for the fact that the gauge readings are only taken once a week.

Discharge Measurements of Nahatlatch River 7 Miles from Mouth.

NICOLA RIVER, AT MOUTH.—(2030).

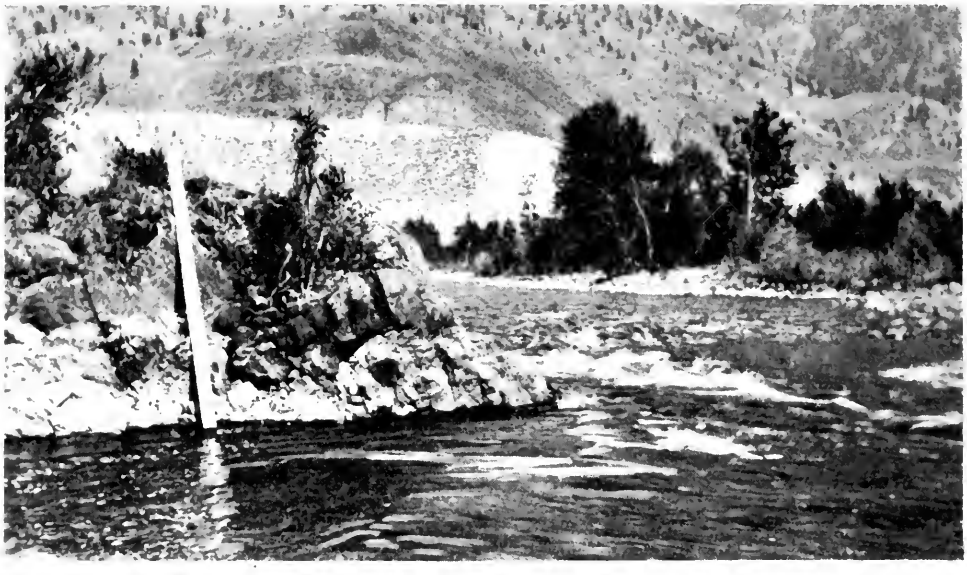
Location.—Section 12, township 17, range 25, west 6th meridian.

Records Available.—August 1 to November 31, 1911; April 5 to December 21, 1912; May 9 to December 11, 1913; April 1 to September 30, 1914; April 1 to September 30, 1915.

Drainage Area.—Two thousand six hundred and fifty square miles.

Gauge.—Incline staff gauge read three times a week by Miss Violet Curnow.

Channel.—Straight at measuring section. Velocity high. Bed of stream is composed of rocks and gravel. During high water on the Thompson river the control is affected at the measuring section but not at the gauge.



Nicola river, at mouth. Inclined staff gauge bolted to solid rock.

Discharge Measurements.—Are made from bridge at all stages. Eleven measurements made during 1912-13-14 agree fairly well and cover practically the whole range of stage.

Winter Flow.—Ice conditions exist usually during January, February and March.

Accuracy.—"C." Results should be fairly reliable at all stages, though no measurements have been made during 1915.

Nicola River, at Merritt.—(2029).

Location.—At Merritt; Water District No. 3.

Records Available.—June 16 to December 31, 1911; January 31 to December 31, 1912; January 1 to December 31, 1913; January 1 to December 31, 1914; April 1 to December 31, 1915.

Drainage Area.—One thousand five hundred square miles.

Gauge.—Standard vertical staff gauge read tri-weekly by Miss C. A. Seaton.

Channel.—The bed of the stream is gravelly and the flow is in two channels during high water. The channel seems to be shifting considerably.

Discharge Measurements.—Between discharges of 200 and 1,200 cubic feet per second, the rating curve has been located by four measurements made during 1915. For lower discharges a comparison was made with the station on the Nicola river, near Nicola lake, and on the Coldwater river. For higher discharges, the 1914 measurements were used.

Winter Flow.—Open conditions usually prevail most of the winter.

Accuracy.—"C." The accuracy is somewhat impaired by the shifting of the channel and also by the fact that the gauge readings are not taken every day.

Discharge Measurements of Nicola River at Merritt.

NICOLA RIVER, AT NICOLA.—(2075).

Location.—At Nicola; Water District No. 2.

Records Available.—April 14 to August 31, 1913; February 22 to December 31, 1915.

Drainage Area.—One thousand three hundred square miles.

Gauge.—Vertical staff read daily by V. H. Harbord.

Channel.—Rocky; permanent control; high banks.

Discharge Measurements.—Ten measurements made by the Provincial Water Rights Branch in 1913, and five measurements made by the B.C. Hydrometric Survey in 1915 agree very well and cover practically the whole range of stage for 1915, and all but the peak of the freshet for 1913.

Winter Flow.—Partial ice conditions in January.

Accuracy.—"B" and "C." Results should be very reliable except for discharges above 700 cubic feet per second.

Co-operation.—This station was established April 11, 1913, by A. G. Woolsey, of the Provincial Water Rights Branch, and the gauge readings and meter measurements for 1913 were taken under his direction. The station was taken over by the B.C. Hydrometric Survey, February 10, 1915.

Discharge Measurements of Nicola River at Nicola.

Nicola River, above Nicola Lake.—(2086).

Location.—At highway bridge, six miles from Nicola Lake; Provincial Water District No. 3.

Records Available.—Records have been kept from May 12 to September 16, 1915, which will be available when the station is more completely rated.

Gauge.—Vertical staff read by W. M. Lauder.

Channel.—Rocks and gravel; stream confined between abutments of highway bridge.

Discharge Measurements.—Three measurements in 1915 under open water conditions and one under ice cover. More measurements are needed at high and low stages.

Accuracy.—The discharges computed should be quite reliable.

Discharge Measurements of Nicola River above Nicola Lake.

NOTE.—Station only partly rated during 1915.

SPIUS CREEK.—(2037).

Location.—Section 23, township 13, range 23, west of 6th meridian.

Records Available.—August 18 to November 22, 1911; May 8 to September 12, 1912; May 25 to November 30, 1913; March 22 to December 24, 1914; March 7 to October 15, 1915.

Drainage Area.—Three hundred and forty-four (344) square miles.

Gauge.—Standard chain gauge read daily by G. A. Longbotham.

Channel.—The channel is composed of rocks and boulders; velocity of water is high at all stages.

Discharge Measurements.—Six discharge measurements were obtained during 1914 at varying stages, and curve is fairly well defined. One ice measurement in 1915.

Winter Flow.—Ice conditions exist from November to February.

Accuracy.—"C." A high accuracy value cannot be assigned, since no measurements under open water conditions have been made during 1915.

Discharge Measurements of Spius Creek at Longbotham's Ranch.

THOMPSON RIVER, AT SPENCES BRIDGE.—(2039).

Location.—Section 10, township 17, range 25, west of 6th meridian.

Records Available.—October 25 to December 31, 1911; January 1 to December 31, 1912; January 1 to December 31, 1913; January 1 to December 31, 1914; January 1 to December 31, 1915.

Drainage Area.—Twenty-one thousand square miles.

Gauge.—Gauge is standard chain gauge, situated on traffic bridge, read daily by Miss Violet Curnow.

Channel.—The channel varies in width from 400 feet to 500 feet. Depth of section at high water greater by 16 feet than at low. Velocities range from 2 to 11 feet per second.

Discharge Measurements.—Measurements are made from traffic bridge. Owing to great velocity at high water, meterings are difficult to obtain. However, curve is well defined.

Winter Flow.—River usually remains open throughout the year.

Accuracy.—"B." Results are considered to be quite accurate at all stages.

Discharge Measurements of Thompson River at Spences Bridge.

Thompson River, at Kamloops.—(2040).

Location.—Lower highway bridge, below mouth of North Thompson river, at Kamloops; section 7, township 20, range 17, west of 6th meridian.

Gauge Readings.—These readings show the elevation of the water level in the Thompson and are interesting for navigation and pumping; the station has shown itself unsuitable for determining discharge. Gauge read daily by Geo. Clapperton.

Discharge Measurements.—Six meter measurements made during 1915 are listed under Miscellaneous Measurements, Kamloops district.

Mean Daily Gauge Height, in Feet, of Thompson River at Kamloops.

Christina Lake.—(2086).

Location.—Near Grand Forks; Provincial Water District No. 5.

Gauge Readings.—These readings show the level of the water in Christina lake, January 1 to December 31, 1914, and March 21 to September 30, 1915. Gauge read by W. H. Beach.

Co-operation.—This gauge was installed under the supervision of Mr. A. V. White, Consulting Engineer of the Conservation Commission and Mr. Wm. Young, Comptroller of the Provincial Water Rights Branch.

Mean Daily Gauge Height, in Feet, of Christina Lake for 1914.

REPORT

OF THE

BRITISH COLUMBIA HYDROMETRIC SURVEY FOR 1915.

CHAPTER VIII.

Nelson Division—Hydrometric Data.

CHAPTER VIII.

NELSON DIVISION—HYDROMETRIC DATA.

NELSON DISTRICT.

CARPENTER CREEK.—(3025).

Location.—The station is in the flume back of the C.P.R. depot, at Sandon.

Records Available.—1914 and 1915.

Drainage Area.—Twelve square miles.

Climatic Conditions.—Summers hot. May and June generally wet. Little rain during July and August. Winters mild. Snowfall is not heavy in the lower altitudes. Frazil ice is a possibility.

Gauge.—Enamel gauge, 0 feet to 3 feet, nailed to side of flume; daily readings are made by Mrs. E. A. Cameron.

Flume.—The creek is carried through Sandon in a box flume, 11.67 feet wide and 6 feet deep. Kutter's formula was applied to determine the discharges.

Accuracy.—During high water results are probably within 10 per cent, but at low stages, as the gauge reads only to tenths, no accuracy can be given.

Daily Gauge Height and Discharge of Carpenter Creek at Sandon for 1915.

The Year	288.0	12.0	62 9	5 25	71.54	45,737

Note.—As the gauge is read only to the nearest tenth, no accuracy can be given for the lower flow. At higher stages results are probably within 10 per cent.

Columbia River, Castlegar.—(3004).

Location.—At C.P.R. bridge, near Castlegar.

Records Available.—1913-14-15.

Drainage Area.—Fifteen thousand square miles.

Climatic Conditions.—Summers hot, with plenty of rain in May and June, but very little during July and August. In winter the snowfall is not heavy, and the temperature seldom goes below zero. The river rarely freezes over.

Gauge.—A chain gauge read daily by Mr. W. J. Farmer.

Channel.—Straight for 200 yards above and below section. A pronounced riffle in low water is lost during high water. The rise and fall of the river is about 25 feet.

Discharge Measurements.—The 1915 curve is based on fifteen measurements made during 1913-14-15.

Accuracy.—"A" and "B." During 1915 as no very high water was encountered results are probably within 5 and 10 per cent.

The year	86,100	7,450	36,490	2.43	33.20	26,586,000

Columbia River, Trail.—(3008).

Location.—The station is at the highway bridge, near Trail, 15 miles above International boundary and above mouth of Pend d'Oreille river.

Records Available.—1913-14-15.

Drainage Area.—Thirty-four thousand square miles.

Climatic Conditions.—Considerable rain usually falls in the spring. June, July, August and September are usually dry. October and November are generally unsettled, but not cold. Winters are mild, and the summers hot

Gauge.—Chain gauge used and read by Mr. C. A. Broderick.

Channel.—The river has a bend about 100 yards above the bridge. Below the river is straight for 400 yards. Control appears to be permanent, and is a pronounced riffle 100 yards below section.

Discharge Measurements.—The 1915 curve is based on twenty measurements, during 1913-14-15. These measurements were well distributed.

Accuracy.—"B" and "C." Reliable daily gauge readings have been obtained. The rating curve appears reliable. Results should be within 10 or 15 per cent.

Discharge Measurements of Columbia River at Trail (For Curve).

Duncan River.—(3066).

Location.—About 10 miles above the mouth, at the highway bridge, 1 mile south of Howser.

Records Available.—December 1914, and all of 1915.

Drainage Area.—Not determined.

Climatic Conditions.—Considerable rainfall in spring and fall. Winters and summers temperate.

Gauge.—A vertical staff, nailed to the wharf at Howser, about 1 mile above measuring section. Daily readings made by Mr. Wm. Simpson.

Channel.—The section is situated about midway in a straight stretch of over 1,500 feet.

Discharge Measurements.—The rating curve was compiled from one measurement made in November, 1914, and four well-distributed measurements in 1915.

Accuracy.—"B" and "C." The readings are reliable. The section is good. Results should be within 10 and 15 per cent.

General.—The Duncan river rises in the Selkirk and Purcell mountains, and flows south through the Purcell trench into Kootenay lake. There is considerable timber along this river, and a number of promising but undeveloped mining properties. The stream is swift, but in portions is suitable for small boats.

Discharge Measurements of Duncan River at Howser.

Fry Creek.—(3070).

Location.—The section is located about ¾ mile above mouth of creek, and about ½ mile above canyon, about 2 miles from Johnston's Landing.

Records Available.—December 1914, and all of 1915.

Drainage Area.—Not determined.

Climatic Conditions.—Summers are hot and generally dry in July and August; the winters are mild. The temperature seldom goes below zero. The snowfall is not heavy, but there is considerable rainfall in spring and fall. The creek freezes over during cold spells, but seldom for more than two weeks at a time. Frazil ice is a possibility.

Gauge.—The gauge is just below canyon, and is painted on a sloping rock. Mr. W. Holmgren reads the gauge weekly.

Channel.—Straight for about 200 feet above the cable station, and for 100 feet below. The bed is of broken rock formation. Current swift.

Discharge Measurements.—The 1915 data has been prepared from a rating curve based on five measurements during the year. These were, with one exception, made from cable car.

Accuracy.—This stream has its source near or in the summit of the Purcell mountains, and is subject to considerable variation. As gauge readings were only made once a week no accuracy can be given at present.

General.—Fry creek is the third largest tributary to Kootenay lake. It has its source about 20 miles from the mouth, in the summit of the Purcells. It is a mountain torrent, with extreme high flow in the summer months, and a very low flow in winter. There are good power possibilities at the canyon, particularly for 9 months of the year. Placer mining has been carried on for several years, and it is contended that there is still gold in the bed.

Glacier Creek.—(3071).

Location.—At footbridge, about 1 mile above the mouth, and about 2 miles south-east of Howser.

Records Available.—June to November, 1915.

Drainage Area.—Not determined.

Climatic Conditions.—Considerable rainfall in spring and fall. Winters and summers temperate. It is probable that at the source in the higher altitudes the precipitation is heavy.

Gauge.—A vertical staff read three times a week by Mr. C. Malloch.

Channel.—Very swift water, running over a bed of boulders.

Discharge Measurements.—A measurement was made in November 1914; and three in 1915, and on these the present data has been based.

Accuracy.—"D." This stream is a mountain torrent. At low water it is difficult to get measurements with precision. At high water it is practically impossible. Hence the accuracy will not be guaranteed but is thought to be within 20 per cent.

General.—Glacier creek rises in the Purcell mountains, flows westerly, and empties into the Duncan river about 2 miles below Howser. It is only about 12 miles in length but it carries considerable water, especially during June, July, August and September. There are timber resources, and a number of promising mineral claims in this vicinity.

GOAT RIVER.—(3031).

Location.—Immediately above bridge, near Erickson, 5 miles from Creston.

Records Available.—1914 and 1915.

Drainage Area.—Not determined.

Climatic Conditions.—Similar to Nelson. (See Kootenay river, Nelson.) The river generally freezes over, but only for two or three weeks at a time, frazil ice is to be expected.

Gauge.—A vertical staff, located immediately above head of canyon, 20 yards from Canyon siding. The control is permanent.

Channel.—At the gauge it is permanent, but is liable to shift below the measuring section.

Discharge Measurements.—The 1915 data is based on seven well-distributed measurements in 1914, and four in 1915. An ice measurement on February 19, 1915, gave a discharge of 167 c.f.s.

Accuracy.—"A" and "B." Daily readings have been obtained, and good measurements were made. Results should be within 5 and 10 per cent.

Inonoaklin Creek.—(3084).

Location.—At second highway bridge, about 2 miles from mouth, in the vicinity of Edgewood.

Records Available.—June to December, 1915.

Drainage Area.—Not determined.

Climatic Conditions.—Considerable rainfall during spring and fall. Winters and summers temperate.

Gauge.—A vertical staff, attached to buttress just above the measuring section, was read daily by Mr. W. R. Colegrave.

Channel.—At the section the water has an even flow with a control about 100 yards below, which appears more or less permanent.

Discharge Measurements.—Four well distributed measurements were obtained, and on these the rating curve has been based.

Accuracy.—"A" and "B." Gauge readings and measurements are reliable, the results should be within 5 and 10 per cent.

General.—Inonoaklin creek is about 20 miles long, and drains the Fire valley which is fairly well settled and has great agricultural possibilities. The creek empties into the Lower Arrow lake, near Edgewood, and is important as a possible source of water supply and power. About half a mile from the mouth a drop of 30 feet or more occurs.

Discharge Measurements of Inonoaklin Creek at Edgewood for 1915.

Kaslo Creek.—(3029).

Location.—The section is at the second highway bridge above the mouth, in Kaslo.

Records Available.—1914 and 1915.

Drainage Area.—One hundred and seventy square miles.

Climatic Conditions.—The summers are hot and generally dry in July and August; the winters are mild. The temperature seldom goes below zero. The snowfall is not heavy, but there is considerable rainfall in spring and fall. The creek freezes over during cold spells, but seldom for more than two weeks at a time. Frazil ice is a possibility.

Gauge.—Chain gauge is read daily by Mr. W. F. Hurst, of Kaslo.

Channel.—The bed of the stream is broken, with boulders, but is apparently permanent. The water flows swiftly, and at an angle to the section.

Discharge Measurements.—The 1915 data is prepared from a rating curve based on five measurements taken in 1914 and four in 1915.

Accuracy.—"C" and "D." Daily readings were obtained and the curve is fair. Results should be within 15 per cent.

The period	1,910	82	600	3.53	40.14	364,090

Kooskanax Creek.—(3022).

Location.—At bridge, above canyon, 1 mile from Nakusp, and about 1 mile from the mouth.

Records Available.—May to December, 1914, and practically all of 1915.

Drainage Area.—One hundred and twenty-five square miles.

Climatic Conditions.—Summers hot and fairly dry. Winters are mild. Thermometer occasionally goes below zero, but the mean temperature of the winter months is probably 25 degrees to 35 degrees Fahr. Frazil ice may be expected for a few days at a time only.

Gauge.—A chain gauge was installed and is read by Mr. J. H. Stevenson.

Channel.—The stream is confined between perpendicular walls, 38 feet apart, at the section. The control is a sand and gravel bar, which shifts considerably.

Discharge Measurements.—The 1915 rating curve is based on seven well-distributed measurements made during the year.

Accuracy.—"D." No gauge readings were made from May 6 to 25 inclusive, and other readings were only taken twice a week. The results are considered to be within 20 per cent.

Discharge Measurements of Kooskanax Creek at Nakusp for 1915.

Monthly Discharge of Kooskanax Creek at Nakusp for 1915.

(Drainage area, 125 square miles.)

Month.	Discharge in Second-Feet.				Run-Off.	
	Maximum.	Minimum.	Mean.	Per square mile.	Depth in inches on Drainage area.	Total in acre-feet.
January	195	151	164	1.31	1.51	10,100
February	155	115	125	1.00	1.04	6,940
March	151	115	127	1.01	1.16	7,810
April	1,190	162	695	5.56	6.20	41,400
June	1,340	683	869	6.95	7.75	51,700
July	1,070	340	661	5.29	6.10	40,600
August	329	151	213	1.70	1.96	13,100
September	184	142	156	1.25	1.39	9,280
October	455	162	238	1.90	2.19	14,600
November	397	162	235	1.88	2.10	140,000
December	162	130	140	1.12	1.29	8,610
The period	1,340	115	329	2.63	32.69	218,140

Note.—No gauge readings were taken from May 6 to May 25. As gauge readings were only made twice a week the accuracies cannot be guaranteed closer than 20%.

Kootenay River.—(3075).

Location.—The gauge is located below the tail-race of the West Kootenay Power and Light Company's plant No. 2, at Upper Bonnington, 10 miles west of Nelson, and about 15 miles above the mouth of the Kootenay.

Records Available.—October, 1907, to October, 1915, through the courtesy of the above-mentioned company.

Drainage Area.—Seventeen thousand eight hundred square miles.

Climatic Conditions.—These are similar to Nelson (see Kootenay river, Nelson). The river never freezes over, and very little, if any, frazil ice is formed.

Gauge.—A vertical staff, below the tail-race, read daily by Mr. G. L. Thompson, of the West Kootenay Power and Light Company.

Method of Compilation.—The discharge curve is obtained by subtracting the discharge of Slocan river from the discharge of Kootenay river, near Glade.

Accuracy.—"B." Not guaranteed, owing to the difficulties with Slocan River curve, to be closer than 10 per cent.

Daily Gauge Height and Discharge of Kootenay River at Bonnington Falls for 1915.

Kootenay River.—(3014).

Location.—The station is located 10 miles above the mouth of the river, at ferry cable put in by the Doukhobour colony, near Glade.

Records Available.—1913-14-15.

Drainage Area.—Nineteen thousand one hundred square miles.

Climatic Conditions.—Similar to those at Nelson (see Kootenay river, Nelson). The river is open all the year round.

Gauge.—Staff gauges are used and read daily by Mr. F. Striloiff.

Channel.—Straight and uniform. There are riffles 1,000 yards above and below section.

Discharge Measurements.—The 1915 rating curve is based on six meterings made in 1913, six in 1914, and two in 1915.

Accuracy.—"A." The section is ideal for metering purposes. The curve is satisfactory. Results are considered within 5 per cent.

KOOTENAY RIVER.—(3077).

Location.—The gauge is located at Astley's wharf, Nelson, 25 miles above the mouth of river.

Records Available.—1913-14-15.

Drainage Area.—Seventeen thousand seven hundred square miles.

Climatic Conditions.—Winters are mild, with light snowfall. Occasionally the west arm of the lake freezes over. The summers are temperate, with occasional hot days, but the evenings are always cool. Precipitation is heaviest during the spring and fall. July, August and September are considered the dry months.

Gauge.—A vertical staff, 20 feet long, and read daily by Mr. W. F. Mawdsley.

Method of Compilation.—The discharge curve is obtained by subtracting the discharge of Slocan river from the discharge of the Kootenay, near Glade, allowing for the inflow between Nelson and Glade, which is less than 1 per cent.

Accuracy.—"B." Cannot be guaranteed, owing to the difficulties with the Slocan river rating curve, to be closer than 10 per cent.

Daily Gauge Height and Discharge of Kootenay River at Nelson for 1915.

(Drainage area, 17,700 square miles)

Pend d'Oreille River.—(3017).

Location.—The gauging section is located 9 miles above the mouth, near Mr. A. G. Lang's ranch, in the vicinity of Waneta.

Records Available.—May, 1913, to September, 1915.

Drainage Area.—Twenty-six thousand six hundred square miles.

Climatic Conditions.—Precipitation is light over practically all of the Pend d'Oreille drainage area. The summers are hot and fairly dry, the winters mild, temperature seldom going below zero. The river, in Canada, seldom freezes over, and frazil ice will not be a serious factor.

Gauge.—Vertical staff gauges were used and read two or three times weekly, except during high water (when daily readings were taken), by Mr. A. G. Lang.

Channel.—The Pend d'Oreille, through Canada, is very swift, and there are few, if any, favorable metering sections. The section chosen is very fast in high water, but satisfactory at low water, and appears to have a permanent control.

Discharge Measurements.—The 1915 rating curve is based on six measurements in 1913, three in 1914, and six in 1915.

Accuracy.—"A," "B" and "C." Readings, as a rule, were only taken two or three times weekly, and high water measurements were not altogether satisfactory, therefore, the results cannot be guaranteed closer than 15 per cent, though at the lower stages of the water it is thought to be within 5 and 10 per cent.

Discharge Measurements of Pend d'Oreille River at Waneta (For Curve).

Silverton Creek.—(3027).

Location.—At bridge, about 3 miles from the mouth, and about $\frac{1}{4}$ mile below the Hewitt mill.

Records Available.—1914 and 1915.

Drainage Area.—Not determined.

Climatic Conditions.—Summers hot, with light rainfall after June. Winters mild, moderate snowfall. The creek does not stay frozen more than a few days at a time. Frazil ice may be expected occasionally.

Channel.—Swift water, with rocky bed.

Discharge Measurements.—The 1915 data is based on six measurements in 1914, and five in 1915.

Accuracy.—"D." The section is not suitable for good measurements, and accuracy cannot be guaranteed, but should be within 20 per cent.

Discharge Measurements of Silverton Creek at Silverton (Below Mill) (For Curve).

December	44.5	38.0	40.8			2,510
The period	480.0	35.0	115.9			77,190

Silverton Creek.—(3028).

Location.—Immediately above intake of flume of Hewitt mill, about 5 miles from Silverton.

Records Available.—1914 and 1915.

Drainage Area.—Thirty square miles.

Climatic Conditions.—Summers hot, light rainfall, after June. Winters not very severe, moderate snowfall. The creek does not remain frozen for more than a few days at a time. Frazil ice and anchor ice to be expected at times.

Gauge.—A vertical staff read daily by Mr. P. Harding.

Channel.—Water smooth and swift, controlled by Hewitt diversion dam.

Discharge Measurements.—The 1915 rating curve is based on five measurements in 1914 and five in 1915.

Accuracy.—"C." Results should be within 15 per cent.

Discharge Measurements of Silverton Creek at Silverton (Above Intake) (For Curve).

Slocan River.—(3018).

Location.—The section is located at a highway bridge about a mile from the mouth of the river and near Crescent valley.

Records Available.—1913-14-15.

Drainage Area.—One thousand three hundred square miles.

Climatic Conditions.—Similar to Nelson (see Kootenay river, Nelson).

Gauge.—A vertical staff, nailed to bridge pier. Read by Mr. R. T. Symms.

Channel.—Straight above and below section. Inclined to shift. One side of the channel often filled with logs. Control not satisfactory.

Discharge Measurements.—Seven measurements were made in 1913, five in 1914, and four in 1915.

Accuracy.—"B." Results are not published during April, May, June, July, August and September, as the gauge readings are not relative to the discharge, due to the lumber company sluicing logs at their plant below the gauging station. Results published are considered within 10 per cent.

March	850	700	754	0.58	0.67	46,400
October	850	800	811	0.62	0.72	49,900
November	850	800	820	0.63	0.70	48,800
December	800	750	773	0.59	0.68	47,500
The period	850	700	769	0.59	4.00	277,900

NOTE.—Owing to peculiar conditions below the gauging section the gauge readings for April to September are in doubt. The results for the months given are thought to be fairly accurate.

REVELSTOKE DISTRICT.

Akolkolex River.—(3000).

Location.—The station is in section 35, township 22, range 1, west of the 6th meridian, about one mile from Wigwam, at the bridge where wagon road crosses the river above the falls.

Records Available.—1913-14-15.

Drainage Area.—One hundred and five square miles.

Climatic Conditions.—Summers hot and moderately dry. Heavy snowfall during winters. Thermometer rarely goes below zero. Stream at section seldom freezes, except for a day or two. Anchor ice seldom forms for more than one or two days at a time.

Gauge.—Chain gauge used. Gauge readings taken three times a week, from May to October, inclusive, for the balance of the year one reading a week. J. A. Lewis, gauge reader, Wigwam.

Channel.—Straight for 100 yards above and below section. Current swift through box canyon. Control is rock and appears permanent.

Accuracy.—"B," "C" and "D." Accurate measurements were made, but as gauge readings are not daily the mean monthly discharge cannot be guaranteed closer than 15 per cent.

Discharge Measurements of Akolkolex River at Wigwam (For Curve).

Blaeberry River.—(3002).

Location.—Section 29, township 28, range 22, west of 5th meridian, 11 miles north of Golden, about 1 mile from the mouth, on downstream side of C.P.R. bridge.

Records Available.—1912–13–14–15.

Drainage Area.—Three hundred and twenty-five square miles.

Climatic Conditions.—Summers hot and dry, with occasional heavy rains. Winters severe, with light snowfall. Ice conditions exist generally from November 15 to April 1.

Gauge.—Vertical staff, read three times a week by H. M. Cooper, until July, when chain gauge was established.

Channel.—Straight for 50 yards above and below station. Water runs swiftly and is controlled by a sand-bar, about 100 yards downstream. This bar probably shifts. Exceedingly high water on the Columbia may affect gauge readings.

Discharge Measurements.—Measurements are made from downstream side of railway bridge. 1915 data is compiled from one measurement in 1913, five in 1914, and five in 1915.

Accuracy.—"C." As gauge readings are not taken daily results are considered only within 15 per cent.

Discharge Measurements of Blaeberry River at Moberly (For Curve).

The period	4,160	200	1,080	3.29	30.01	520,000

Bugaboo Creek.—(3003).

Location.—About 3 miles south-west of Spillimacheen Landing, on down-stream side of highway bridge, 1 mile from mouth.

Records Available.—1912-13-14-15.

Drainage Area.—One hundred and ninety square miles.

Climatic Conditions.—Summers hot and dry. Winters severe, light snowfall. The creek usually freezes over in November and does not open again till April.

Gauge.—A vertical staff, nailed to pier of bridge, and read in the open season by Mr. Jas. Montgomery, daily.

Channel.—Straight, 100 feet above and below gauge. Current swift during freshet. One channel during low water and two at high water.

Discharge Measurements.—The 1915 rating curve is based on three measurements in 1912, six in 1913, three in 1914, and four in 1915.

Accuracy.—"B" and "C." The control is apparently permanent, daily readings are made, and the 1915 curve appears reliable. Above gauge height of 1.4 the results should be within 10 per cent, and below 1.4 15 per cent.

Discharge Measurements of Bugaboo Creek at Spillimacheen Landing (For Curve).

COLUMBIA RIVER, GOLDEN.—(3005).

Location.—Station is in section 12, township 27, range 22, west of 5th meridian, 1 mile from Golden.

Records Available.—During the open season from 1903 to 1915. Gauge heights from 1903 to 1911 were obtained through the courtesy of the Columbia River Lumber Company. One ice measurement made in February, 1912, gave a discharge of 795 c.f.s., and one made in February, 1914, gave a discharge of 894 c.f.s.

Drainage Area.—Two thousand five hundred square miles.

Climatic Conditions.—Summers are warm and dry. Winters severe. Ice conditions generally exist from the middle of November till the end of March. Frazil ice is to be expected.

Gauge.—A vertical staff read daily during open season by Mr. J. T. Wood.

Channel.—The section is located in the middle of a straight stretch of river of 1,500 feet. At low water there is a pronounced riffle 300 yards below gauge, but this disappears at high water.

Discharge Measurements.—Measurements made from cable car. The 1915 rating curve is based on eighteen measurements made during 1911-12-13-14-15.

Accuracy.—"C." Gauge readings are good. 1915 results should be within 15 per cent.

The period	10,600	1,260	5,610	2.24	17.94	2,459,000

Columbia River, Revelstoke.—(3007).

Location.—Section 33, township 23, range 2, west of 6th meridian, above the mouth of Illecillewaet river, on downstream side of highway bridge, at Revelstoke.

Records Available.—1912-13-14-15.

Drainage Area.—Nine thousand square miles.

Climatic Conditions.—Summers are hot, with considerable rainfall. Winters are fairly cold, with heavy snowfall. Frazil ice forms in large quantities.

Gauge.—Chain gauge read daily during open season. Mr. J. H. Jones read the gauge till September, Mr. S. Anderson thereafter.

Channel.—About 1,000 feet wide, controlled by a fairly permanent sand-bar.

Discharge Measurements.—1915 data is based on nine measurements during 1913 and 1914, and four during 1915.

Accuracy.—"A" and "B." Accurate gauge readings and fair conditions for metering. Results are considered to be within 5 and 10 per cent.

Monthly Discharge of Columbia River at Revelstoke for 1915.

(Drainage area, 9,000 square miles.)

Month.	Discharge in Second-Feet.				Run-Off.	
	Maximum.	Minimum.	Mean.	Per square mile.	Depth in inches on Drainage area.	Total in acre-feet.
April	31,300	9,600	19,900	2.21	2.47	1,180,000
May	74,500	29,200	51,900	5.77	6.65	3,190,000
June	84,900	42,800	61,300	6.81	7.60	3,650,000
July	91,500	61,700	77,700	8.63	9.95	4,780,000
August	99,000	65,800	85,600	9.51	11.00	5,260,000
September	62,900	15,200	30,300	3.37	3.76	1,800,000
October	20,200	10,800	14,300	1.59	1.83	879,000
November	17,700	8,400	11,400	1.27	1.42	678,000
December	9,000	7,700	8,050	0.89	1.03	495,000
The period	99,000	7,700	40,050	4.45	45.71	21,912,000

Note.—No gauge readings were made from August 29 to September 16. The discharges were interpolated by referring to gauge at Arrowhead. No accuracy is given for September.

Field Springs 1, 2, 3.—(3062, 3063, 3064).

Location.—In township 28, range 18, west of 5th meridian, about ¼ mile east of C.P.R. hotel, at Field.

Records Available.—October 16 to December 31, 1914, and all of 1915.

Drainage Area.—Not determined.

Climatic Conditions.—In summer the days are usually hot and the nights cool, June is generally a wet month, July and August dry ones. In winter the snow generally falls in October or November and remains till April.

Discharge Measurements.—Discharges are obtained from these springs by means of weirs. There are three weirs and readings were taken daily at the different gauges on Nos. 1 and 2 throughout the year, and at No. 3. from the first of April till the end of the year, by Messrs. Jackson and Bell. These weirs were established to determine the water supply for Field and the C.P.R. shops.

Monthly Discharge of Field Springs at Field (Weir No. 2) for 1915.

Month.	Discharge.				Run-Off.	
	1 Maximum.	2 Minimum.	3 Mean.	4 Per square mile.	Depth in inches on Drainage area.	Total in acre-feet.
January	164,000	132,000	0.281	152,000		
February	148,000	132,000	0.272	147,000		
March	148,000	132,000	0.251	136,000		
April	148,000	118,000	0.243	131,000		
May	434,000	132,000	0.578	312,000		
June	670,000	412,000	0.882	476,000		
July	821,000	616,000	1.290	697,000		
August	616,000	434,000	0.950	513,000		
September	455,000	349,000	0.712	384,000		
October	349,000	288,000	0.578	312,000		
November	308,000	269,000	0.516	279,000		
December	269,000	233,000	0.467	252,000		
The year	821,000	118,000	0.585	316,000		

No. 1.—This column gives maximum daily flow, in gallons, for month.
No. 2.—This column gives minimum daily flow, in gallons, for month.
No. 3.—This column gives mean discharge, in second-feet, for month.
No. 4.—This column gives mean daily flow, in gallons, for month.

SESSIONAL PAPER No. 25e

Daily Gauge Height and Discharge of Field Springs at Field (Weir No. 3) for 1915

No. 1.—This column gives maximum daily flow, in gallons, for month.
No. 2.—This column gives minimum daily flow, in gallons, for month.
No. 3.—This column gives mean discharge, in second-feet, for month.
No. 4.—This column gives mean daily flow, in gallons, for month.

Findlay Creek.—(3036).

Location.—At highway bridge, on Findlay creek road, about 15 miles from the mouth, and 7 miles from Thunder hill.

Records Available.—1914 and 1915.

Drainage Area.—Not determined.

Climatic Conditions.—Summers hot and dry, winters severe with light snowfall. Frazil ice is to be expected.

Gauge.—A vertical staff, near Mason's cabin, about 1½ mile below measuring section. Daily readings were taken by Mr. O. Mason.

Channel.—Rocky above and below section, not likely to shift.

Discharge Measurements.—The 1915 data is based on one measurement made in 1913, five in 1914, and one in 1915.

Co-operation.—This station has been maintained by co-operation with the Provincial Water Rights Branch.

Accuracy.—"D." Accuracy should be within 20 per cent.

Hospital Creek.—(3053).

Location.—At dam above intake of old smelter flume, 1½ mile from Golden.

Records Available.—October and November, 1914, and all of 1915.

Drainage Area.—Eighteen square miles.

Climatic Conditions.—Similar to Golden. Summers are warm and dry, winters severe. Ice conditions generally exist from the middle of November till the end of March. Frazil ice is to be expected.

Weir.—A 10-foot Cippoletti weir.

Accuracy.—Readings at the gauge were only made once a week, so the accuracy cannot be expected to be closer than 20 per cent.

Co-operation.—The weir was established by Mr. O. J. Bergoust, of the Provincial Water Rights Branch. Mr. Bergoust kindly sent copies of readings, in 1914, and this year they have been sent direct by the reader, Mr. D. C. Robertson, of Golden.

The year	82.90	1.13	12.90	0.72	9.80	9,419.9

Note.—Readings at the gauge, generally speaking, were only made once a week,—therefore an accuracy closer than 20 per cent cannot be expected.

Illecillewaet River.—(3009).

Location.—This station is located about 1 mile from the mouth of the river and 1 mile from Revelstoke, at highway bridge.

Records Available.—1911-12-13-14-15.

Drainage Area.—Four hundred and eighty square miles.

Climatic Conditions.—At Revelstoke the precipitation from December 1, 1913, to November 30, 1914, was approximately 40.5 inches. The snowfall is approximately 10 feet, and the precipitation during the months December to March was 18 inches, practically all of which would be snow at higher altitudes. The winters are not severe, being seldom below 10 degrees Fahr. Frazil ice may be expected. The summer days are very hot, sometimes going as high as 100 degrees Fahr.

Gauge.—A chain gauge, referenced to two bench marks is used and read by Miss S. Moran, about 1 mile above the measuring section.

Channel.—The section at the gauge is very fast in high water, and at the measuring section there is a possibility of backwater from the Columbia during high flow. The control at the gauge appears permanent.

Discharge Measurements.—The 1915 data is based on a rating curve prepared from one measurement in 1913, ten in 1914, and four in 1915.

Accuracy.—"B" and "D." Daily readings were obtained, results should be within 10 per cent.

The period	4,960	215	2,032	4.30	44.09	1,130,300

Incomappleux River.—(3030).

Location.—At the highway bridge, about 2 miles from Beaton.

Records Available.—1914 and 1915.

Drainage Area.—Four hundred and sixty square miles.

Climatic Conditions.—Similar to Revelstoke. The snowfall is heavy in the hills. Winters not severe. Summers hot. Frazil ice is to be expected.

Gauge.—A chain gauge about ½ mile above section is read daily by Mr. Jas. Burbridge.

Channel.—At the gauge the water is swift. The measuring section is satisfactory.

Discharge Measurements.—The 1915 data is compiled from a rating curve based on two measurements in 1913, six in 1914, and four in 1915.

Accuracy.—"B." The curve appears reliable. Results are considered within 10 per cent.

KICKING HORSE RIVER.—(3011).

Location.—The station is located at traffic bridge, in Golden; section 12, township 27, range 22, west of 5th meridian.

Records Available.—Open season of 1912-13-14-15.

Drainage Area.—Seven hundred square miles.

Climatic Conditions.—Summers hot and quite dry. Winters severe. Snowfall is 3 to 4 feet. Frazil ice will be found at this point as well as practically up to its source.

Gauge.—A vertical staff gauge used, and read twice daily by Mr. W. Wenman, of Golden.

Channel.—Straight for 200 yards above and below section. The control is a sandbar about 200 yards downstream from section.

Discharge Measurements.—The 1915 rating curve was prepared from one metering in 1911, two in 1912, one in 1913, six in 1914, and six in 1915. A metering under ice conditions was made on February 22, 1912, and gave a discharge of 172 c.f.s. Another on February 28, 1914, gave a discharge of 276 c.f.s. A third on March 2, 1915, gave a discharge of 154 c.f.s.

Accuracy.—"B." Readings are reliable, measurements accurate, results should be within 10 per cent.

KICKING HORSE RIVER.—(3012).

Location.—The station is in township 28, range 18, west of 5th meridian, below the mouth of Yoho river, on first traffic bridge, about 3¼ miles east of Field.

Records Available.—Open season, 1912-13-14-15.

Drainage Area.—One hundred and thirty square miles.

Climatic Conditions.—Summers are short, with some very hot days, and nights generally cool. The rainfall in summer months varies greatly, but is usually much less in July and August than in June. Winters are cold, with occasional severe storms. The river, near Field, is generally frozen for three or four months, and frazil ice is to be expected.

Gauge.—A chain gauge is read daily by Mr. Wm. Tarr, of Field.

Channel.—The channel is straight for 50 yards above and below station, the current is swift during freshet, the control is fairly permanent, but shifted slightly in 1915.

Discharge Measurements.—The 1915 rating curve was prepared from twenty-seven well-distributed measurements.

Accuracy.—"C" and "D." Gauge readings are reliable, and the measurements are accurate, and though a slight shift was noted, results are considered to be within 15 per cent.

November	112	69.0	87.4	0.67	0.75	5,200
The period	3,500	45.0	933.0	7.17	65.57	453,900

Kicking Horse River.—(3013).

Location.—Township 28, range 18, west of 5th meridian, above mouth of Yoho river, immediately above C.P.R. bridge over Kicking Horse, between tunnels Nos. 1 and 2, 5 miles east of Field.

Records Available.—July to October, 1912, April, 1913, to December, 1914, and all 1915.

Drainage Area.—Fifty square miles.

Climatic Conditions.—Similar to Field, with possibly a little more snow.

Gauge.—Vertical staff gauge read by Mr. C. E. Hamilton, and later by Mr. W. J. Hartley.

Channel.—Straight for 25 yards above and below section. Control is not permanent.

Discharge Measurements.—The 1915 rating curve is deduced from seven well-distributed measurements made during the year.

Accuracy.—"B" and "C." At high water the measuring section is not satisfactory. The control below the gauge is not permanent. The results are considered to be within 15 per cent.

Discharge Measurements of Kicking Horse River at No. 2 Tunnel for 1915.

No. 2 Creek.—(3015).

Location.—The section is located about 2 miles from the mouth of the creek, at highway bridge, on road from Wilmer to Forster's landing.

Records Available.—June to October, 1912, May to October, 1913, April to November, 1914, and April to October, 1915.

Drainage Area.—One hundred and twenty square miles.

Climatic Conditions.—Precipitation is light, the summers are hot and dry, winters severe.

Gauge.—A staff gauge is used and is read by Mr. F. B. Hume.

Channel.—The section is in the middle of a straight stretch of 100 feet, the bed is rocky, gravelly and sandy, and may shift a little.

Discharge Measurements.—The 1915 rating curve is based on one measurement in 1914 and five in 1915.

Accuracy.—"B," "C" and "D." Meterings are reliable, but as readings are taken only three times a week, results vary from 10 to 20 per cent.

Discharge Measurements of No. 2 Creek at Forster's (For Curve).

SPILLIMACHEEN RIVER.—(3019).

Location.—The station is located at highway bridge, near mouth of river, about 4 miles from Spillimacheen landing.

Records Available.—June to October, 1912, June to November, 1913, April to December, 1914, and April to December, 1915.

Drainage Area.—Five hundred and eighty square miles.

Climatic Conditions.—The summer generally has hot days with cool nights, light precipitation. The winter is of about 4½ months duration, with considerable snowfall and low temperatures. The river usually freezes up in November or December, opening up again in April.

Gauge.—Vertical staff read two or three times weekly by Mr. Jas. Montgomery.

Channel.—The channel is straight above and below section for 50 yards, the control is a gravel bar, and there is a pronounced riffle at low water, 25 yards below the section.

Discharge Measurements.—The data for 1915 has been prepared from a rating curve based on nineteen measurements, well distributed, during the years 1912-13-14-15.

Accuracy.—"B" and "C." As readings are not taken daily, and there is a possibility of backwater in extreme high water, results cannot be considered closer than 10 or 15 per cent.

Toby Creek.—(3020).

Location.—The section is located at highway bridge, on road from Athalmer to Wilmer, 1½ miles from Athalmer and 1 mile from mouth of creek.

Records Available.—June to September, 1912, May to October, 1913, April to November, 1914, and April to November, 1915.

Drainage Area.—One hundred and eighty square miles.

Climatic Conditions.—Precipitation is light. Summer days are hot and the evenings cool. Duration of winter is about four months, and severe at times. Chinook winds occasionally strike the locality, and changes in temperature result. Toby creek remains frozen about four months of the year.

Gauge.—A vertical staff read by Mr. H. H. Peters of Wilmer.

Channel.—The channel is straight above the section and widens out below. Two channels are formed by a central pier in the bridge. The water does not flow at right angles to the bridge, and runs swiftly.

Discharge Measurements.—The 1915 data is prepared from a rating curve based on three measurements in 1914, and six in 1915, all of them well distributed.

Accuracy.—"C." Results considered to be within 15 per cent.

North Vermilion Creek.—(3032).

Location.—The section is located about 200 yards above the highway bridge, on the road from Golden to Windermere.

Records Available.—1913-14-15.

Drainage Area.—Twenty square miles.

Climatic Conditions.—Summer days are hot, with cool nights, precipitation is light, winters more or less severe and of about four months duration.

Gauge.—Vertical staff read three to five times a week by Mr. S. B. Harrison.

Channel.—Clean and gravelly, likely to shift.

Discharge Measurements.—The 1915 rating curve is based on three measurements in 1913, taken by Provincial Water Rights Branch, six in 1914 taken by this survey, and five in 1915.

Accuracy.—"C" and "D." Generally considered to be within 15 per cent.

SOUTH VERMILION CREEK.—(3033).

Location.—The section is about 40 feet above the highway bridge, on the Golden-Windermere road, which crosses this creek, and is about ½ mile above the mouth.

Records Available.—April to September, 1914, and April to September, 1915.

Drainage Area.—Ten square miles.

Climatic Conditions.—Summer days hot, with cool nights. Precipitation is generally light. Winter lasts about 4½ months, and is more or less severe.

Gauge.—Vertical staff read daily by Mr. Eric Smith.

Channel.—Gravelly and likely to shift.

Discharge Measurements.—The 1915 data has been prepared from a rating curve based on four measurements made by this Survey and one by the Provincial Water Rights Branch, in 1915.

Accuracy.—"C" and "D." Results considered to be within 15 or 20 per cent.

Washout Creek.—(3054).

Location.—The section is located in wooden flume, which is about 20 feet long, and situated about 200 feet above the district schoolhouse, near Galena.

Records Available.—1914 and 1915.

Drainage Area.—Not determined.

Climatic Conditions.—See Spillimacheen river. Similar conditions prevail.

Gauge.—Vertical staff, located in the flume, and read by Mr. H. Alton.

Channel.—Straight for 10 feet above and below section. Water flows swiftly. The natural channel is rough and rocky.

Discharge Measurements.—The 1915 data has been prepared from a rating curve based on five measurements by this Survey and five by Provincial Water Rights Branch, well distributed, in 1914 and 1915.

Accuracy.—"D." This stream is subject to considerable variation, and the accuracy cannot be considered closer than 20 or 25 per cent.

General.—Studies are being made of this stream for possible irrigation and other requirements.

CRANBROOK DISTRICT.

BULL RIVER.—(3039).

Location.—The station is near the mouth, on C.P.R. bridge, at Bull river.

Records Available.—1914 and 1915.

Drainage Area.—Four hundred and twenty square miles.

Climatic Conditions.—Summers hot and dry. Winters severe, with light snowfall at lower altitudes. Ice conditions from November to April. During this period low flow may be anticipated, and frazil ice expected.

Gauge.—A vertical staff nailed to the buttress about 100 yards below Bull River Lumber Company's dam. Daily readings.

Channel.—Straight for 100 yards below and above gauge.

Discharge Measurements.—The 1915 data is based on seven measurements made during the year.

Accuracy.—The channel is liable to shift, and peculiar conditions exist, therefore results are not guaranteed. Further study is being made.

Monthly Discharge of Bull River at Bull River for 1915.

(Drainage area, 420 square miles.)

Month.	Discharge in Second-Feet.				Run-Off.	
	Maximum.	Minimum.	Mean.	Per square mile.	Depth in inches on Drainage area.	Total in acre-feet.
April	3,450	400	1,550	3.69	4.12	92,200
May	4,120	1,490	2,470	5.88	6.78	152,000
June	3,860	1,760	2,630	6.26	6.98	156,000
July	3,450	1,360	1,960	4.67	5.38	120,000
August	1,360	685	992	2.36	2.72	61,000
September	685	500	596	1.42	1.58	35,500
The period	4,120	400	1,699	4.06	27.56	616,700

Note.—Drainage area in doubt. These computations not guaranteed.

Cherry Creek.—(3038).

Location.—Near Wasa, about 1 mile above mouth.

Records Available.—1913-14-15.

Drainage Area.—Eighty square miles.

Climatic Conditions.—Summers hot and dry, winters severe, with light snowfall.

Gauge.—A vertical staff located on highway bridge. Daily readings made by Roy Myers.

Channel.—Channel is regular and affords a good measuring section. Slight shifts are possible.

Discharge Measurements.—The 1915 curve is based on four measurements made by Provincial Water Rights Branch in 1913, three in 1914, by the B.C. Hydrometric Survey, and four during 1915.

Accuracy.—Results should be within 15 per cent.

Monthly Discharge of Cherry Creek at Wasa for 1915.

(Drainage area, 80 square miles.)

Month.	Discharge in Second-Feet.				Run-Off.	
	Maximum.	Minimum.	Mean.	Per square mile.	Depth in inches on Drainage area.	Total in acre-feet.
May	120	78.1	96.5	1.21	1.39	5,930
June	124	67.0	97.1	1.21	1.35	5,780
July	97.3	56.9	76.2	0.95	1.10	4,690
August	54.4	17.3	32.1	0.40	0.46	1,970
September	30.0	17.3	24.6	0.31	0.35	1,460
The period	124	17.3	65.3	0.82	4.65	19,830

Note.—No readings were made for the first week in August, during which the gauge dropped from 7.0 to 4.5 inches. No accuracy is given for this month, as the discharges for this week were interpolated.

Elk River.—(3048).

Location.—At cable station, 50 yards above traffic bridge, ¼ mile from Elko, in south-east Kootenay.

Records Available.—1914 and 1915.

Drainage Area.—One thousand six hundred square miles.

Climatic Conditions.—Summers hot and dry, winters severe, with light snowfall. Frazil ice is to be expected.

Gauge.—A chain gauge was established at the highway bridge and a vertical staff at the cable station. These were read by Mr. Jas. McKee daily.

Channel.—The channel below the bridge is confined in a canyon, and there is no possibility of shift, though log jams might occasionally affect the gauge readings. Above and below the station the channel is straight for about 40 yards. There is a distinct riffle 30 yards below the section at low water,—but this is drowned at high water by the water backing up in its endeavour to get through the narrow canyon below. The low water control below the station may shift somewhat in high water.

Discharge Measurements.—The 1915 rating curve was based on one measurement in November, 1913, six in 1914, and six well-distributed measurements in 1915. On December 18, 1914, a measurement under ice conditions gave a discharge of 630 c.f.s., and one on February 23, 1915, gave a discharge of 601 c.f.s.

Accuracy.—Gauge readings and measurements are reliable, the rating curve is satisfactory, results should be within 10 or 15 per cent.

Gold Creek.—(3047).

Location.—The station is at a highway bridge, ½ mile from mouth. 7 miles from International boundary line, near Newgate, in south-east Kootenay.

Records Available.—1914 and 1915.

Drainage Area.—Two hundred and thirty square miles.

Climatic Conditions.—Winters severe, with light snowfall, summers hot and dry.

Gauge.—A wooden staff, 4 feet long, located on downstream side of bridge, and read three times a week by Mr. C. Thompson.

Channel.—Gravel bed. Flow is fairly smooth. Control is a gravel bar below.

Discharge Measurements.—The 1915 curve is based on five measurements made in 1914, and five in 1915.

Accuracy.—"B" and "C." Measurements are reliable. Results are within 10 or 15 per cent.

Discharge Measurements of Gold Creek at Newgate (For Curve).

Kootenay River.—(3041).

Location.—This station is at the highway bridge, near Wardner.

Records Available.—1914 and 1915.

Drainage Area.—Five thousand two hundred square miles.

Climatic Conditions.—Summers hot and dry. Winters severe. The river is generally affected by ice from December to March. A precipitation of from 16 to 20 inches may be expected. Frazil ice occurs.

Gauge.—A vertical staff, 12 feet long, is nailed to one of the bridge piers, and read daily by Mrs. C. Barnes.

Channel.—The channel is straight and uniform.

Discharge Measurements.—The 1915 rating curve is based on fifteen measurements made during 1913-14-15.

Accuracy.—"A" and "B." Gauge readings and measurements are reliable. The rating curve is satisfactory, and results are considered to be within 5 and 10 per cent.

Linklater Creek.—(3045).

Location.—The section is at Smith's ranch, six miles from Newgate.

Records Available.—1913-14-15.

Drainage Area.—Forty-two square miles.

Climatic Conditions.—Precipitation is light, usually not in excess of 20 inches. Summers hot and dry, winters severe.

Gauge.—A 3-foot enamel gauge is nailed to a footbridge, and is read daily by Mr. Alex. F. Smith.

Channel.—Smooth and unbroken.

Discharge Measurements.—The 1915 data was prepared from a rating curve based on five measurements in 1914 and five in 1915.

Accuracy.—"C." Measurements and readings reliable. Results within 15 per cent.

Mark Creek.—(3037).

Location.—The section is near the mouth of the creek, at Marysville, about 14 miles from Cranbrook.

Records Available.—1914 and 1915.

Drainage Area.—Ninety square miles.

Climatic Conditions.—Precipitation is light, seldom over 20 inches. The summers are hot and dry, the winters severe. The creek freezes over in November or December, till March. Frazil ice is to be expected.

Gauge.—Enamel gauge, 6 feet long, is read daily by Mr. M. W. Burdette.

Channel.—Straight and rocky, the flow is generally broken. The section may fill, but the control appears permanent.

Discharge Measurements.—The 1915 rating curve was based on eight measurements made in 1914 and five in 1915.

Co-operation.—This station was maintained by co-operation with the Provincial Water Rights Branch, during 1914.

Accuracy.—"B." The rating curve is satisfactory, and results are considered to be within 10 per cent.

Moyie River.—(3056).

Location.—The section is at the International boundary, at highway bridge, near Kingsgate.

Records Available.—July to December, 1914, and all of 1915.

Drainage Area.—Five hundred and seventy square miles.

Climatic Conditions.—Winters and summers are temperate. In summer hot days occur, but the evenings are cool. As a rule the river does not freeze over, but frazil ice is to be expected.

Gauge.—A vertical staff is attached to the abutment of the bridge, and daily readings were made by Mr. John Dunlop.

Channel.—The flow at the section is swift, over gravel and small boulders. Straight above and below for 200 feet.

Discharge Measurements.—The 1915 data is based on a rating curve prepared from eight measurements made during the year.

Accuracy.—"C." Meterings are reliable. Gauge readings taken daily. Results are considered to be within 15 per cent.

General.—The Moyie rises in the summit of the Purcell mountains, flows easterly into Moyie lake, thence south-westerly and crosses the International boundary near Kingsgate. In Canada it drains approximately 570 square miles. Studies are being carried on to meet the possible requirements of lumbering and mining industries.

The period	2,620	117	582.4	1.02	11.63	353,050

Phillips Creek.—(3046).

Location.—Near Roo's ranch, Roosville, a few hundred feet above road.

Records Available.—May to November, 1914, and April to September, 1915.

Drainage Area.—Twenty-three square miles.

Climatic Conditions.—Summers are hot and dry, winters severe, as low as forty degrees below zero, during some cold spells. Light snowfall. Frazil ice may be expected.

Gauge.—A wooden staff read by Mr. Fred Roo.

Channel.—Fairly uniform and smooth. Good control.

Discharge Measurements.—The 1915 curve is based on three measurements in 1914, and four in 1915.

Accuracy.—"B" and "C." The rating curve is satisfactory, and readings also. Results should be within 10 or 15 per cent.

Rock Creek.—(3049).

Location.—½ mile above Rock creek mill, near Elko.

Records Available.—1914 and 1915.

Drainage Area.—Seventy-five square miles.

Climatic Conditions.—Similar to Elko (see Elk river).

Gauge.—A 2-foot wooden staff, read four or five times a week, by Mr. H. B. Stiven, of Elko.

Channel.—Smooth. Swift water. Good control.

Discharge Measurements.—The 1915 data has been prepared from a rating curve based on five well-distributed measurements during the year.

Accuracy.—"C." The results should be within 15 per cent.

Big Sand Creek.—(3042).

Location.—The section is located about 300 yards below the highway bridge, 2 miles from Galloway, near Jaffray.

Records Available.—1914 and 1915.

Drainage Area.—Forty square miles.

Climatic Conditions.—Summers hot and dry, winters severe, with light snowfall.

Gauge.—Vertical staff read daily by Robt. Cameron.

Channel.—Smooth and uniform, with swift water and a good control.

Discharge Measurements.—The 1915 rating curve is based on five measurements in 1914 and five in 1915.

Accuracy.—"A" and "B." The section is suitable for good work, and readings are reliable, results should be within 10 per cent.

LITTLE SAND CREEK.—(3043).

Location.—The section is located at the small traffic bridge, above Rosen's ranch, near Jaffray.

Records Available.—1914 and 1915.

Drainage Area.—Thirty-three square miles.

Climatic Conditions.—Summers hot and dry, winters severe, with light snowfall.

Gauge.—Vertical staff, nailed to bridge abutment, and read by Mr. A. Rosen.

Channel.—Uniform. Water unbroken and swift. Control is fair.

Discharge Measurements.—The 1915 data is based on a rating curve prepared from two measurements in 1914, and five in 1915.

Accuracy.—"C." Results are thought to be within 15 per cent.

St. Mary's River.—(3050).

Location.—At traffic bridge, near Wycliffe, 12 miles from the mouth, and 7 miles from Cranbrook.

Records Available.—1914 and 1915.

Drainage Area.—One thousand one hundred square miles.

Climatic Conditions.—The climatic conditions near Wycliffe are similar to those at Cranbrook. Summers hot, with dry winds, winters severe, with occasional cold spells, during which it may reach forty degrees below zero. Precipitation is light. Frazil ice is to be expected.

Gauge.—A vertical staff gauge read daily by the Otis Staples Lumber Company till the end of September.

Channel.—Straight, uniform, with smooth swift flow. Good control.

Discharge Measurements.—The 1915 rating curve is based on six measurements made by the Provincial Water Rights Branch, in 1912 and 1913, four measurements made by this survey in 1914, and three in 1915.

Accuracy.—"B" and "C." Results should be within 10 or 15 per cent.

REPORT

OF THE

BRITISH COLUMBIA HYDROMETRIC SURVEY FOR 1915.

CHAPTER IX.

Fort George District—Hydrometric Data.

CHAPTER IX.

FORT GEORGE DISTRICT.

HYDROMETRIC DATA.

Bulkley River.

Bulkley river is one of the largest tributaries of the Skeena. It rises on the western slope of the interior plateau and flows in a north-westerly direction to join the Skeena, near Hazelton. The Bulkley is about 150 miles in length and drains an area of about 3,900 square miles.

The Bulkley is a rough, unnavigable stream and flows through many rapids and canyons. For 30 miles above its mouth it flows through a deep and narrow canyon, falling 1,000 feet in this distance. The valley enclosing Bulkley river is very large, varying from four to ten miles in width. On the south-west, from Hazelton to Moricetown, this valley is flanked by the rugged Rocher Deboules mountains, and from Moricetown to Barrett, by Hudson Bay mountains. On the north-east the mountains are lower and not as rugged.

There are no power developments as yet, but the Bulkley canyon affords probably one of the best power possibilities in northern British Columbia.

The principal tributaries of the Bulkley are, the Morice and Telkwa rivers, Bull, Boulder, Porphyry and Mud creeks on the south; Canyon and Driftwood creeks and Suskwa river on the north.

There are at present two gauging stations on the Bulkley river. One is at Hubert, above the mouth of the Telkwa river, the other is at Hazelton at the mouth. This latter station is to give the flow through the Bulkley canyon. The gauging station at Hubert was established in July, 1915, and records are available from then till December 31. Measurements are made from the downstream side of the highway bridge. A vertical staff gauge is nailed to the pier, at the south end of the bridge.

The metering station at Hazelton is at the ferry crossing about half a mile from the mouth. Daily gauge readings have been taken since July, 1915, on a chain gauge at the low level suspension bridge, 2 miles above the metering station. Meter measurements are made from the Government pontoon ferry, a tag line is stretched from shore to shore to mark points of observation, the ferry being held in place by the current action on the face of the pontoons.

High level suspension bridge, 250 feet above Bulkley river, near New Hazelton.
Old Indian bridge in background.

Kettle river, at Cascade.
The drop in this canyon is utilized by the Cascade power plant of the West Kootenay Power and Light Co.
Total head, 156 feet.
—Photograph by Lake Studio, Grand Forks.

Bulkley River, Hazelton.—(4004).

Location.—At ferry crossing, about ¼ mile above confluence with Skeena river, ¾ of a mile from Old Hazelton.

Records Available.—Gauge heights from July 13 to December 31, 1915. Insufficient data to compute daily discharges.

Drainage Area.—Approximately 3,900 square miles.

Gauge.—Chain gauge at low level suspension bridge, over Bulkley canyon, 2 miles above metering section. Daily readings by Mr. A. M. Ruddy.

Channel.—One channel at all stages. Straight above and below section. The stream bed appears to be permanent. The depth of water at the section is influenced at some stages by backwater from the Skeena river.

Discharge Measurements.—Four measurements in open season and one in early winter.

Winter Flow.—The river freezes over early in December. Frazil and anchor ice remain in the river for most of the winter.

Discharge Measurements of Bulkley River near Hazelton, B.C., for 1915.

Date.	Engineer.	Meter No.	Width.	Area of Section.	Mean Velocity.	Gauge Height.	Discharge.
			Feet.	Sq. ft.	Ft. per sec.	Feet.	Sec.-ft.
July 14	Chisholm & Challies	1,521	460	1,890	6.11	18.42	11,580
Aug. 27	Elliott & Challies	1,521	473	1,460	5.59	13.5	8,160
Sept. 25	J. A. Elliott	1,521	470	1,210	4.47	11.0	5,410
Oct. 22	J. A. Elliott	1,521	470	1,304	4.80	11.2	6,260

Bulkley River, Hubert.—(4003).

Location.—At highway bridge, near Hubert, and about 3 miles above the mouth of Telkwa river.

Records Available.—July 8 to December 31, 1915.

Drainage Area.—Approximately 2,070 square miles.

Gauge.—Vertical staff gauge, nailed on upstream side of pier at south end of bridge. Daily readings by Mrs. F. Norris.

Channel.—Divided into three sections by bridge piers. Straight above and below for 250 feet. Section is influenced by a curve in the channel about 300 feet above the bridge.

Discharge Measurements.—Four measurements during the open season of 1915.

Winter Flow.—The river freezes over about the end of November. Ice jams, frazil and anchor ice affect the winter flow.

Accuracy.—"C" and "D." For gauge heights above 2.5 feet results should be within 15%. Below 2.5 feet results are probably within 20%.

Discharge Measurements of Bulkley River near Hubert, B.C., for 1915.

Dore River.

The Dore or Fifty Mile river rises in the Cariboo mountains, about 25 miles south-west of the town of McBride, and flows north to the Fraser river. The town of McBride is about 2½ miles east of the mouth of the Dore. Dore river has a fairly steep gradient and several small power sites. It will probably afford a water or power supply for McBride, as it is the most important stream in this vicinity.

Dore River.—(4002).

Location.—About ½ mile above the confluence with the Fraser river, and below all tributaries. The station is on the Grand Trunk Pacific Railway bridge, about 2½ miles west of McBride, B.C.

Records Available.—July 2 to November 25, 1915.

Drainage Area.—Approximately 190 square miles.

Gauge.—Chain gauge fastened to a supported rod on the right bank, about 100 yards above the railway bridge. Gauge is read two or three times a week, by Miss M. Johnson, of McBride.

Channel.—The channel is straight above and below the section for 50 yards. The river bed is liable to shift. One channel at all stages.

Discharge Measurements.—Three well-distributed measurements in 1915, and one ice measurement in winter.

Winter Flow.—The river freezes over in November, and does not appear to carry frazil ice or anchor ice.

Accuracy.—"D." The gauge readings are infrequent, and the station newly established. Results should be within 20%.

SESSIONAL PAPER No. 25e

Nechako River.

The Nechako river rises at the western end of the lake region of the great interior plateau, south of the Grand Trunk Pacific. The Nechako has its source in Ootsabunket and Cheslatta lakes, at an elevation of about 2,900 feet, and, after flowing about 70 miles in a north-easterly direction, almost touches the eastern end of Fraser lake, and then turns nearly due east along the 54th parallel, holding this direction for 100 miles to its confluence with the Fraser at Fort George. Near Fraser lake the Upper Nechako receives the waters from Fraser and François lakes.

Nechako river may be said to be of three main branches:—the Upper Nechako, which drains Ootsabunkut, Cheslatta, Natalkuz, Euchu, and Tetachuck lakes; the Nautley and Endako rivers which drain François and Fraser lakes; and the Stuart which drains Tacla, Tremblay and Stuart lakes. The drainage area of the Nechako basin is about 15,700 square miles.

The Nechako valley proper is in reality an old lake bed and its soil is very rich. It averages 15 miles in width and contains several thousand acres of excellent farming land.

The lower Nechako was navigated by small river steamers, from Fort George to Fort Fraser, during the construction of the Grand Trunk Pacific Railway. As early as 1871, a 70-foot steamer, the "Enterprise," made a trip from Soda creek to Tacla lake, during the Omineca gold rush. The remains of this steamer are now beached on Tremblay lake. During the summer of 1915 the Department of Public Works, Canada, did considerable improvement work on the Stuart river rapids to make a navigable waterway at all stages from the railway to the Omineca mining region.

There are no power developments on the Nechako at present. The total fall between Ootsabunkut, or Ootsa lake, and the Fraser is about 860 feet, of which 80 feet is in the short stretch between Ootsa and Natalkuz lakes. Near the Cheslatta Creek rapids, about 60 miles up the Upper Nechako, there is a box canyon 12 miles long, which contains many falls and rapids.

Several of the largest lakes in the province are in the Nechako basin,—Ootsa, 140 miles long; Cheslatta, 25 miles; Francois, 60 miles; and Fraser, 14 miles; Stuart (area, 221 square miles); and Tacla, 135 square miles.

There are two gauging stations being maintained on the Nechako river at the present time, one at Vanderhoof, on the Lower Nechako, and one near Fort Fraser, on the Upper Nechako. The gauging station on the Upper Nechako river was established in June, 1915, and daily gauge readings have been taken since that time. Meterings are made from the railway bridge, half a mile west of Fort Fraser. The gauging station on the Lower Nechako, at Vanderhoof, was established in June, 1915. Daily gauge readings are taken and meterings are made from a boat station near the ferry crossing of the Vanderhoof-Stuart lake road. This latter station gives the combined discharges of the Upper Nechako, Nautley and Endako rivers.

Climatic conditions in the Nechako valley are shown by the temperature and precipitation tables for Fort St. James and Fort George. The winter is

generally of 5 months duration, snow coming to stay in mid-November and lasting until the middle of April. The precipitation is light but well distributed throughout the year.

Nechako River, Fort Fraser.—(4000).

Location.—At the Grand Trunk Pacific Railway bridge, about ½ mile west of Fort Fraser townsite.

Records Available.—June 16 to December 10, 1915.

Drainage Area.—Approximately 6,150 square miles.

Gauge.—Vertical staff gauge, nailed to a timber pile on the left bank of the river, about 75 feet above the railway bridge. The gauge is read daily in the open season and semi-weekly in the frozen season, by Mr. F. Clarke.

Channel.—Straight above and below section. Divided into sections by the bridge piers. There is a possibility of shift in the section, due to current action around the piers of the bridge.

Discharge Measurements.—Four well-distributed measurements during the summer of 1915.

Winter Flow.—The river freezes in mid-November, and is frozen until the middle of April. During the early winter months the flow is affected by presence of anchor and frazil ice.

Accuracy.—"C." The station is newly established, but the conditions for metering are good. The results should be well within 15%.

Nechako River, Vanderhoof—(4006).

Location.—At the ferry crossing, about ½ mile from the town of Vanderhoof.

Records Available.—July 21 to November 8, 1915.

Drainage Area.—Approximately 9,500 square miles.

Gauge.—Chain gauge on right bank of river, about 25 yards above ferry landing. Daily gauge readings by Mr. R. Stuart.

Channel.—Permanent channel of even cross-section, straight for 1,000 feet above and below section.

Discharge Measurements.—Four measurements during open season and one in early winter, 1915. Measurements are made from a canoe, anchored to a tagline, 50 feet above the ferry.

Winter Flow.—The river freezes early in November and is frozen over until April. Frazil and anchor ice affect the flow in the early winter.

Accuracy.—"C." The section is good, and the meterings are well distributed. Results should be within 15%.

Skeena River.

The Skeena river is about 335 miles long and drains a territory of about 19,000 square miles. It rises in the eastern slopes of the Coast range and for 180 miles follows the general direction of this mountain system, then, at a point near Hazelton, it turns south-west and cuts across the range, to reach the Pacific ocean. In its upper reaches the Skeena is very swift and flows through numerous canyons and boulder-strewn rapids. The lower part of the river is wide and swift-flowing; it is divided into several channels by the many alluvial islands in its passage through the coast range. Tidal influence extends up the river for about 40 miles.

Prior to and during the construction of the Grand Trunk Pacific Railway, the Skeena was navigated by river steamers to Hazelton, at the mouth of the Bulkley, a distance of 154 miles. Navigation, except near the mouth, is difficult and dangerous.

Probably the most important industry connected with the Skeena river is the salmon fishing. The Skeena is a noted salmon river and several canneries have been established for some years near the mouth.

The main line of the Grand Trunk Pacific Railway follows the lower 154 miles of the river to Hazelton. The route of the proposed extension of this railway from Hazelton to Dawson, follows the upper part of the Skeena for about 130 miles.

The Skeena valley has a general width of 2 miles, decreasing as it ascends. The mountains on either side seldom exceed 3,000 feet in height. The principal tributaries of Skeena river are the Kitsumgallum, Kitwanga, Kispiox, Kuldo, Exchamsiks, Kwinitsa, Seaxe, Kasiks and Exstew, on the north and west; Exstall, Lakelse, Zymoetz, Bulkley, Kitsequekla, Babine, Shequnya, Kleanza and Chimdemash, on the south and west, most of them draining valleys with a considerable extent of agricultural land.

There are no power developments on the Skeena at present. It has a fall of about 725 feet in the 154 miles between Hazelton and its mouth, but the construction of the railway along its banks prevents any extensive utilization for power purposes.

There is at present only one gauging station on the Skeena river. It is located at the Hazelton ferry, about half a mile above the mouth of the Bulkley. This station was established in July, 1915. Readings are made daily from a chain gauge. Discharge measurements are made from the canoe ferry, a tagged line being stretched across the river to mark points of observation.

Skeena River, Hazelton.—(4005).

Location.—At ferry, at Old Hazelton, about ¾ mile above the mouth of Bulkley river.

Records Available.—July 15 to December 31, 1915.

Drainage Area.—Approximately 13,300 square miles.

Gauge.—Chain gauge on a long pole braced over left bank, near ferry. Read daily by Jas. MacKay.

Channel.—Straight above and below section. Bed is permanent and current is very swift. At high stage, surface velocities only can be obtained.

Discharge Measurements.—Four well-distributed measurements during open season, 1915.

Winter Flow.—River freezes over early in December. Winter flow is affected by ice jams near confluence with Bulkley river.

Accuracy.—Below gauge height of 5.0 feet results should be within 15%. Above 5.0 feet within 20%.

PROGRESS REPORT

OF THE

MANITOBA HYDROMETRIC SURVEY

FOR

THE CALENDAR YEAR 1915

BY

M. C. HENDRY, A.M. Can. Soc. C.E.
Chief Engineer

Prepared under the Direction of the Superintendent of Water Power.

PRINTED BY ORDER OF PARLIAMENT

OTTAWA
PRINTED BY J. DE L. TACHÉ,
PRINTER TO THE KING'S MOST EXCELLENT MAJESTY
1917

[No. 25f-1917]

To Field Marshal, His Royal Highness Prince Arthur William Patrick Albert, Duke of Connaught and of Strathearn, K.G., K.T., K.P., etc., etc., etc., Governor General and Commander in Chief of the Dominion of Canada.

May it Please Your Royal Highness:

The undersigned has the honour to lay before Your Royal Highness the Progress Report of the Manitoba Hydrometric Survey for the calendar year 1915.

Respectfully submitted,

W. J. ROCHE,
Minister of the Interior

Ottawa, May 31, 1916.

DEPARTMENT OF THE INTERIOR,
Ottawa, May 31, 1916.

The Honourable W. J. ROCHE, M.D.,
Minister of the Interior.

SIR,—I have the honour to submit the Progress Report of the Manitoba Hydrometric Survey for the calendar year 1915, and to recommend that it be published as Water Resources Paper No. 19 of the Dominion Water Power Branch.

I have the honour to be, Sir,

Your obedient servant,

W. W. CORY,
Deputy Minister of the Interior.

DEPARTMENT OF THE INTERIOR, DOMINION WATER POWER BRANCH,
Ottawa, May 31, 1916.

W. W. CORY, ESQ., C.M.G.,
Deputy Minister of the Interior.

SIR,—I have the honour to submit the attached Progress Report of the Manitoba Hydrometric Survey for the calendar year 1915, by M. C. Hendry, A.M.Can.Soc. C.E., Chief Engineer.

In view of its important bearing on the industrial development of Manitoba, I would recommend that it be published as Water Resources Paper No. 19 of the Dominion Water Power Branch.

Respectfully submitted,

J. B. CHALLIES,
Superintendent.

J. B. CHALLIES, ESQ., C.E ;
Superintendent, Dominion Water Power Branch,
Department of the Interior,
Ottawa, Ont.

Winnipeg, May 1, 1916.

Sir,—

I have the honour to submit herewith the manuscript of the Progress Report of the Manitoba Hydrometric Survey.

This report covers the Hydrometric work carried on by this Survey during the year 1915. I would request that it be published as one of the Water Resources Papers of the Dominion Water Power Branch.

I have the honour to be, sir,

Your obedient servant,

M. C. HENDRY,
Chief Engineer.

PROGRESS REPORT

OF THE

MANITOBA HYDROMETRIC SURVEY

FOR

THE CALENDAR YEAR, 1915

PART 1

PART I

PROGRESS REPORT OF THE MANITOBA HYDROMETRIC SURVEY FOR THE CALENDAR YEAR 1915

INTRODUCTION.

The report presented herewith covers the hydrometric work carried on throughout the province of Manitoba during the Calendar year 1915. There is also included in this report, data that has been collected by officers of the Survey in connection with hydrometric studies made at the Outlets of the Lake of the Woods. The latter information relates particularly to gauge heights, etc., which were observed by different interested parties at various times prior to the interception of the work of the Manitoba Hydrometric Survey at this point. The information so obtained is of great value and was compiled, collated and made available to the Consulting Engineers of the International Joint Commission for use in connection with the reference relating to the regulation of the Lake of the Woods.

The gathering of hydrometric data is of prime importance, not only from a hydraulic power standpoint, but also in connection with other uses of the surface water supply. The various uses for which stream flow data is required in Manitoba may be enumerated as follows:—

1. Domestic, municipal and manufacturing purposes.
2. Irrigation.
3. Water power.
4. Drainage.
5. Sewage disposal.
6. Navigation.
7. Flood prevention.

Throughout the Provinces numerous towns and villages are dependent upon the rivers for their domestic water supply; the demand will rapidly increase with the population and information with regard to the amount of water available will be essential.

In the southwestern part of the Province where the average annual rainfall varies between 14 and 17 inches and where agriculture is chiefly pursued, irrigation may become important. Throughout the Province many of the rivers present power possibilities, and studies have been made of them with a view to determining their probable economic value. The true value of these potential water powers cannot be determined without a thorough knowledge of the water available in the streams, particularly under low water conditions. In the northern and southeastern portions of the Province, the reclamation of large tracts of land by drainage may be profitably undertaken. With the rapid filling up of the country, the necessity of throwing open reclaimed lands for settlement will become more pressing, and in connection with such reclamation schemes, a complete knowledge of the streams forming the natural outlets for such drainage schemes is a prime requisite.

The use of the streams of the Province in connection with sewage disposal will soon command attention, as the rapid growth of the towns and villages will render necessary the regulation of waste disposal from these municipalities in such a manner as to obviate any possible danger to the rest of the community. In order that this question may be handled intelligently, a knowledge of the discharge of the streams is of extreme importance.

Several of the main rivers in the Province might be utilized for navigation purposes, in fact before the coming of the railway the Red River was the only means of communication with the outside world. Improvement for navigation purposes is being urged in many quarters and demands the study of this and other streams.

ORGANIZATION AND SCOPE.

The organization of the survey is the same as in former years, though a number of changes in the personnel have occurred, due, almost without exception, to enlistment for active service.

The methods used in collecting the data are based upon those followed by the Water Resources Division of the United States Geological Survey. The different streams to be studied are investigated and suitable sites selected for the establishment of metering stations, the selection of the stations depending upon the physical features and the need of data in any particular locality. At these metering stations, gauges are established and some person living in the locality is engaged to read the gauge daily. These daily observations are recorded in a book provided for the purpose, which is examined by the engineer on each of his visits. The readings as entered in the book are transferred to cards by the gauge reader and forwarded weekly to the Chief Engineer. The records are then copied on forms and filed in the office. At the end of each three months the gauge books are renewed, the old ones are forwarded to the office and the readings, as copied from the cards, are checked against those entered in the gauge books by the gauge reader. At the end of the season, discharge curves are constructed for each station from the results of the meterings. Rating tables are compiled and with these and the records of daily gauge heights as a basis, tables of Daily, Monthly and Yearly Discharge are computed. These are the results which are published herein.

On the organization of the Manitoba Hydrometric Survey, the work of the Winnipeg River Power Survey was merged with it, and the former now carries on all hydrometric storage, power or river improvement investigations. By this arrangement the work naturally falling within the scope of the survey may be carried on systematically and conservation may be dealt with in a comprehensive manner with a view to determining the best use of the available water supply.

In gathering this stream flow data it is believed that the results obtained are sufficiently accurate for all practical purposes, the aim being, not to concentrate on few streams and so obtain records of extreme accuracy, but rather to spread the effort over as wide a territory as possible and so serve as many purposes as possible without unduly sacrificing the accuracy of results. In this connection it is essential that the records, in order that they may properly cover all possible range in stage of the rivers investigated, should extend over a considerable term of years. The length of this term will vary with the character and importance of the stream investigated; on some streams the term should be from five to ten years, while in other cases from ten to twenty years is desirable. This variation will depend both upon the importance of the stream and the correlation of the results with the records of other streams in the vicinity. To quote from an authority on this subject,—"the object should be to gauge a certain number of streams at all seasons of the year so as to ascertain their total discharge and its seasonable distribution, also to gauge others at certain stages which have been determined to be the critical points in their regimen." It may be stated here that the United States Geological Survey considers that, owing to the constantly changing flow of the streams, data of reasonable accuracy showing the distribution of flow over several consecutive years are of more importance than very accurate measurements covering short periods of time.

In making use of the records here presented, caution should be exercised in drawing conclusions. Owing to the very limited period of time over which a great many of the records extend, and the fact that the observations are often unsupported by others made before the organization of the survey, considerable error in the conclusions reached may very easily occur.

DISTRICTS.

During the past year seventy stations were operated, at some of these continuous records were obtained, while at others only miscellaneous measurements were secured.

The territory covered by the work is divided, for convenience of description, into several

main divisions, which conform generally to the several drainage systems met with. These may be enumerated as follows:—

1. Winnipeg River and Tributaries.
2. Red River and Tributaries.
3. Assiniboine River and Tributaries.
4. Saskatchewan River and district west of Lake Winnipegosis.
5. East shore of Lake Winnipeg.
6. Hudson Bay Drainage (Nelson River).

WINNIPEG RIVER AND TRIBUTARIES.

This district comprises all the territory lying between the Outlets of the Lake of the Woods and lake Winnipeg which is tributary to the Winnipeg river.

The Outlets of the Lake of the Woods are being given special attention owing to the effect of run-off at this point upon the surface levels of the Lake of the Woods. The reference now before the International Joint Commission relative to the regulation of the lake has necessitated a very comprehensive study of the run-off conditions. The number of outlets from the lake and their method of control has necessitated keeping an engineer and assistant on the ground continuously. Data of a meteorological nature is also being gathered.

The tributaries of the Winnipeg river are not numerous, and with one exception, the English river, are of little magnitude. The English river joins the Winnipeg in the vicinity of the Interprovincial boundary between Ontario and Manitoba, and drains all the country lying to the north and east of the Lake of the Woods district. Lying almost entirely in unsurveyed territory, its drainage area is rather indeterminate, but roughly speaking, it forms somewhat less than one-half of the total tributary drainage area lying above the junction of the two rivers. A station has been established on this river near the mouth, but owing to the remoteness from settlement, it has been found impossible to secure the services of a gauge reader. On this account it has not been possible to determine the daily discharge directly, only scattered meterings being available, but from a consideration of the measurements taken on the Winnipeg river above and below this confluence, the discharge of the English river may be arrived at approximately. The smaller tributaries of the Winnipeg have been metered and records of the discharge kept more or less systematically, depending upon their importance. On the main river, stations have been established at Whitedog falls—north and south channels—and Slave falls, and one on the Pinawa channel near the Control dam, also others at the forebay and tailrace of the Winnipeg Electric Railway plant in the latter channel. The latter stations were established with a view to rating the power plant.

This district lies almost entirely within the Laurentian formation, in fact, the Winnipeg river and the Lake of the Woods may be said to form the southwestern boundary of that formation. This would account in a great measure for the small number of rivers tributary to the basin from the southwest.

The granites and gneisses of the Laurentian formation underlie the whole region, and the topographical features are typical; lakes and rivers abounding throughout the district. Rock outcroppings are very frequent and the soil covering is shallow, conditions which would tend to rapid run-off were they not offset by the numerous lakes and muskegs throughout the district.

The forest covering of the district varies, in some parts it is sparse owing to the shallowness of soil; in other parts dense growths of evergreen such as spruce, pine and balsam are to be found with here and there clumps of birch. Considerable lumbering has been done in the district so that for the most part the larger stands of lumber have been cut off. In other parts the forest has been overrun with fire so that now much of the standing timber is second growth.

RED RIVER DISTRICT.

That portion of the Red River valley lying below the International Boundary and the territory drained by the tributaries with the exception of the Assiniboine, comprises the

Red river District. The nature of the area drained by the river within the Province varies between the swampy muskeg country bordering the Laurentian formation to the east and the open prairie to the west.

Owing to the nature of the eastern part of the drainage area, land reclamation by drainage is to be expected and such work will naturally affect the range in stage of the river and tributaries concerned. This change in regimen caused by the operation of large drainage schemes in the northern part of Minnesota has to some extent already been noticed. These conditions render the study of the river advisable especially owing to the possibility of International questions arising. Drainage already in operation or to be anticipated, however, is not the only reason for collecting hydrometric data. The importance of the river from a navigation standpoint has been put forward on numerous occasions, in fact a careful survey with the idea of its improvement for that purpose was carried out through this organization. Such improvement would not revive an early use of the river as the chief artery of communication and transport with the outside world. In order that all phases of the question may be looked into, metering stations have been established near the International Boundary at Emerson, and at Winnipeg, and gauges were established at several intermediate points. Stations have been operated on the tributaries, viz., the Roseau, the Rat, the Morris and the Seine.

ASSINIBOINE RIVER DISTRICT.

The Assiniboine river which is the chief tributary of the Red, drains the country to the west of the Duck and Riding Mountains and north of the International boundary; some of its tributaries have their source within the province of Saskatchewan. The southern and western part of the drainage area may be termed prairie country, having scattered timber bluffs. The northern section of the area has a greater tree covering, the Riding Mountain district at the source of one of the tributaries being well timbered and lying within a forest reserve. The streams rising in these two areas are characteristic of the country which they drain. One of the chief tributaries, the Souris, has the extreme low winter flow characteristic of the prairie streams. It rises within the province of Saskatchewan, flows southeast, crossing the International boundary into North Dakota, then swings northeast re-crossing the boundary into Manitoba. The stream flows through what may be termed the dry belt of Manitoba, the district drained comprising that part of the Province which has the lowest annual rainfall, this varying between 14 and 17 inches. The Little Saskatchewan, which is also a tributary of the Assiniboine, rises in the Riding Mountains and flows in a general southerly direction joining the main river near Brandon.

As the main river and its branches drain the well populated parts of the Province, it is important as a source of domestic water supply or a means of sewage disposal. In addition to the above, its possible use for irrigation purposes may be anticipated in the southwestern part of the Province, and these demands added to the demand for power purposes render a careful hydrometric study of the river advisable. During the past season a number of new stations have been established on the upper waters of the Little Saskatchewan, in connection with certain water power studies on that river. As opportunity offers it is intended to extend these stations throughout the basin in order that a thorough knowledge of the Assiniboine may be obtained.

SASKATCHEWAN RIVER AND DISTRICT WEST OF LAKE WINNIPEGOSIS.

In this district there are a large number of streams of variable size tributary directly or indirectly to Lake Winnipegosis. The Saskatchewan river, though belonging to the district, flows through the northern portion and empties into lake Winnipeg.

With a few exceptions all the rivers tributary to lake Winnipegosis have their source in either the Riding, Duck or Porcupine mountains. The streams are not of great length and the flow is subject to considerable fluctuation.

Some of these streams are not of immediate interest from a hydrological standpoint, nevertheless as the district becomes populated their importance will increase; new towns

springing up will be dependent on them for water supply and in some cases the success of drainage schemes will depend largely upon the possibility of utilizing the existing streams as outlets. Vast areas along the Saskatchewan river may be profitably reclaimed by channel improvements in the main river combined with a system of interior drainage. Certain of these rivers are capable of development from a power standpoint and the most important in the district viewed from that angle is perhaps the Saskatchewan river. This river has for its drainage basin practically all that section of Alberta and about two-thirds of Saskatchewan lying south of the forty-fourth parallel of latitude. There are several points at which this river might be developed for power purposes.

EAST SHORE OF LAKE WINNIPEG.

In the district covered by the drainage on the east side of lake Winnipeg, the country is for the most part typical of the Laurentian formation, in consequence practically all of the rivers entering on that side of the lake are interrupted at numerous points in their course by falls and rapids. At various points throughout the country are to be found stands of timber which may be utilized either for the manufacture of lumber or for pulp. With these facts in view some studies have been made of the power possibilities of the rivers, but in order that the conclusions reached may be sound, the possible run-off of the rivers should be known. The district is for the most part uninhabited, so it has been impossible to secure gauge readers. Miscellaneous measurements have been taken at various points on the river as the opportunity offered, and with the exception of the station established at Little Grand Rapids on the Berens river where daily records are obtained, these are all the records available.

HUDSON BAY DRAINAGE.

NELSON RIVER.

The Nelson river forms the sole outlet of practically all the drainage areas included in the last six districts. It forms the outlet of lake Winnipeg into which all the rivers, the Winnipeg, Red, Saskatchewan, Berens, Pigeon, Bloodvein and Dauphin (the outlet of lake Winnipegosis and lake Manitoba), empty. The fall of the Nelson between the outlet of lake Winnipeg and Hudson's Bay is in round numbers, 700 feet. A great portion of this is to be found in the form of swifts, rapids and falls. With such a vast drainage area tributary to the river the discharge must be enormous, while with so many lakes forming natural regulation basins, the minimum flow will probably bear a fairly close relation to the mean flow. The natural storage basins encountered in this drainage area are of great proportions and include the following large lakes:—lake Namakan, Rainy lake and the Lake of the Woods on the Winnipeg; lac Seul on the English, lake Manitoba, lake Dauphin, lake Winnipegosis and lake Winnipeg; there are many others of less extent; for in the Winnipeg river basin alone there are, in addition to those named, 106 lakes varying in area from 3 to 140 square miles.

The Nelson with its numerous falls and rapids and excellent natural regulation has great power possibilities, which are increasingly important as the Hudson's Bay railway nears completion and easier and cheaper transportation becomes available. The early development of some of these powers is by no means improbable. The hydrometric work undertaken in 1914 has been continued and an engineer was kept in the district during the winter and summer of 1915. In addition to this work, a number of measurements were secured at various points on the Grass and Burntwood rivers during 1915, stations and bench marks being established so that the work may be continued at a future date.

DEFINITIONS AND TERMS.

The volume of water flowing in a stream (called the "run-off" or "discharge") is expressed in various terms, each of which has become associated with a certain class of work. These terms may be divided into two groups,—

(1) Those which represent a rate of flow as "second-feet," "miner's inches" and "run-off in second-feet per square mile."

(2) Those which represent the actual quantity of water, as "run-off in depth in inches" and "acre-feet."

The units used in this report are "second-feet," "second-feet per square mile," "run-off in inches" and "acre-feet" or "mile-feet." The first two belong to the first group and the last three to the second. They may be defined as follows,—

(a) "Second-feet" is an abbreviation for cubic feet per second (c.f.s.) and is the rate of discharge of water flowing in a stream 1 foot wide, 1 foot deep, at a rate of 1 foot per second, It is generally used as a fundamental unit from which others are computed by the use of factors given in the following table of equivalents.

(b) "Second-feet per square mile" is the average number of cubic feet of water flowing per second from each square mile of area drained, on the assumption that the run-off is distributed uniformly both as regards time and area.

(c) "Run-off in inches" is the depth to which the drainage area would be covered if all the water flowing from it in a given period were conserved and uniformly distributed over the surface. It is used for comparing run-off with rainfall, which is usually expressed in depth in inches.

(d) "Acre-foot" is equivalent to 43,560 cubic feet, which quantity is the number of square feet in one acre. It is the quantity of water required to cover an acre to the depth of one foot, and is the common unit of measurement of quantity. It is generally used in connection with storage.

(e) "Mile-foot" is equivalent to 27,878,400 cubic feet, which quantity is the number of square feet in one square mile. It is the quantity of water required to cover one square mile to a depth of one foot and is equal to 640 acre-feet. While not a common unit of measurement of quantity, it is sometimes made use of in connection with large storage projects to express the quantity of water stored.

CONVENIENT EQUIVALENTS.

1 second-foot equals 35·71 British Columbia miner's inches, or one British Columbia miner's inch equals 1·68 cubic feet per minute.

1 second-foot equals 6·23 British Imperial gallons per second; equals 538·272 gallons for one day.

1 second-foot equals 7·48 United States gallons per second; equals 646,272 gallons for one day.

1 second-foot for one year covers 1 square mile 1·31 feet or 13,572 inches deep.

1 second-foot for one year equals 31,536,000 cubic feet; equals 724 acre-feet.

1 second-foot equals about 1 acre-inch per hour.

1 second-foot for one 28-day month covers 1 square mile 1·041 inches deep.

1 second-foot for one 29-day month covers 1 square mile 1·079 inches deep.

1 second-foot for one 30-day month covers 1 square mile 1·116 inches deep.

1 second-foot for one 31-day month covers 1 square mile 1·153 inches deep.

1 second-foot for one day equals 1·983 acre-feet.

1 second-foot for one 28-day month equals 55·54 acre-feet.

1 second-foot for one 29-day month equals 57·52 acre-feet.

1 second-foot for one 30-day month equals 59·50 acre-feet.

1 second-foot for one 31-day month equals 61·49 acre-feet.

100 British Imperial gallons per minute equals 0·268 second-feet.

100 United States gallons per minute equals 0·223 second-feet.

1,000,000 British Imperial gallons per day equals 1·86 second-feet.

1,000,000 United States gallons per day equals 1·55 second-feet.

1,000,000 United States gallons equals 3·07 acre-feet.

1,000,000 British Imperial gallons equals 3·68 acre-feet.

1,000,000 cubic feet equals 22·95 acre-feet.

1 acre-foot equals 43,560 cubic feet.

1 acre-foot equals 271,472 British Imperial gallons.

1 acre-foot equals 325,580 United States gallons.

1 inch deep on 1 square mile equals 2,323,200 cubic feet.

1 inch deep on 1 square mile equals 0·0737 second-foot per year.
1 acre equals 43,560 square feet.
1 cubic foot equals 6·23 British Imperial gallons.
1 cubic foot equals 7·48 United States gallons.
1 cubic foot of water weighs 62·5 pounds.
1 foot per second equals 0·682 miles per hour.
1 horse-power equals 550 foot pounds per second.
1 horse-power equals 746 watts or ·746 kilowatts.
1 horse-power equals 1 second-foot falling 8·80 feet.

To calculate water-power quickly:—sec. ft. x fall in feet ÷ 11 = net horse-power on water wheel, realizing 80 per cent. of theoretical power.

METHODS OF DETERMINING DISCHARGE.

In Water Resources Paper No. 4 full reference was made to the methods commonly followed in determining the discharge of streams, and it is not therefore considered necessary to repeat the same herein.

EXPLANATION OF DATA.

The following data are given for each regular station:—

1. Description of the station.
2. Table of Discharge Measurements.
3. Table of Daily Gauge Heights and Discharges.
4. Table of Monthly Discharge and Run-off.

The description gives a complete history of the station, noting especially such charges as would effect the records. There is also included information regarding the location and equipment of the station.

In the table of discharge measurements is given the date of each measurement, the name of the field engineer, meter number, width of the section, cross sectional area, mean velocity in the section, the gauge height and the discharge in cubic feet per second.

The table of daily gauge heights and discharge contains a list of the gauge heights for each day reduced to station datum and the corresponding discharge. In some cases the gauge height given is the mean of two or more readings taken at intervals during the day.

The table of monthly discharge and run-off is compiled from the foregoing table. Under "Maximum" is given the greatest mean daily discharge in feet per second occurring during the month, period or year. Similarly under "Minimum" is given the smallest discharge, and under "Mean" the mean discharge for each whole month, period or year. It should be noted that under these headings the figures represent *rates* of flow. In the other part of the table are given under the heading "Run-off Depth in Inches," the depth of which the drainage area could be carried by distributing evenly over the entire area the run-off for each month, period or year. These figures represent *quantities* of water, as do also those under the heading "Total Run-off in Acre-feet."

The size of each drainage area is obtained by planimeter from the area lying within the basin laid down on the sectional maps issued by the Department. These will be revised if necessary from time to time as new maps are issued.

BENCH MARKS.

From time to time the necessity has been felt for good permanent bench marks at the metering stations to which the gauges could be referred. During the early part of the year one was designed and a number secured. The bench mark is made up of a five-foot length of three and a half inch wrought iron pipe, the lower six inches is split and the ends spread, a bronze cap is shrunk on to the upper end, on it being the letters, "B.M. M.H.S." The boss in the centre of the cap is the reference point. The pipe is sunk in the ground, only two or three inches being left above the surface. If rock in place is available, the cap only is used, being drilled and tapped to fit a half inch anchor bolt which may be leaded in a hole drilled

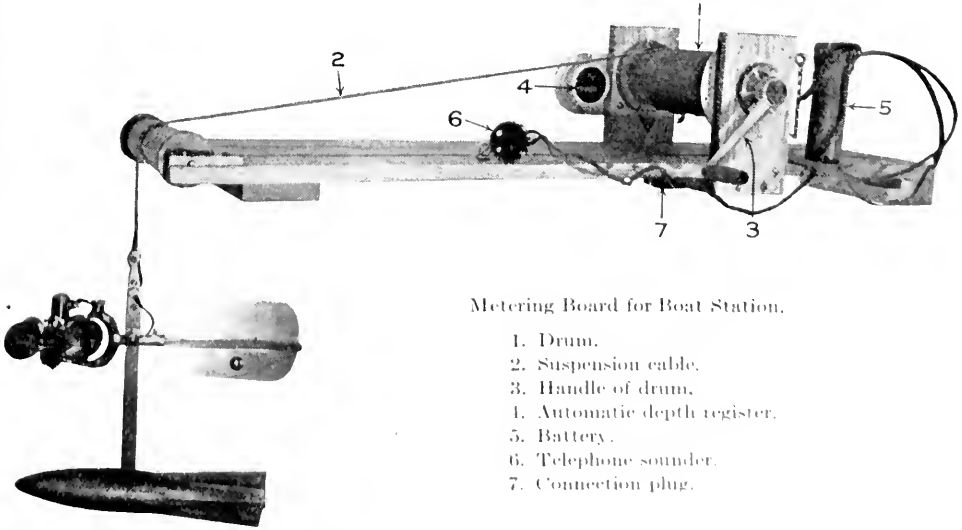
in the rock. A number of these have been placed and wherever possible are referred to some known datum.

METERING ACCESSORIES.

A number of the stations operated are on large streams where depths up to seventy-five feet are encountered. Piano wire has been used for suspending the meter, a small insulated wire forming the second side of the circuit. Lately a special steel cable of small diameter with an insulated copper core has been experimented with and has given good results, the advantage over piano wire being less liability to break through kinking and the elimination of the second wire. Where either method of suspension is adopted, a reel is necessary, so that all the stations where considerable depths are encountered are equipped with reels, a special equipment being used for metering at boat stations.

Mr. W. J. Ireland, Assistant Engineer, during the year designed a counting device for use with the reels and a number of them are now in use. The counting part of the device is similar to that used in gas meters. It is connected to the spindle of the reel by a train of gears, the counter and gears being enclosed in a metal case. Through the connection, each revolution or part of a revolution of the reel or drum is recorded on the dial of the encounter. By turning in one direction the revolutions are added and by reversing the direction they are subtracted. The counter may readily be thrown out of gear and the dial reading brought to zero. By using a reel exactly one foot in circumference and setting the dial to read zero when the meter is at the surface of the water any position with reference to the surface of the water is automatically registered on the dial. The counting device may be detached from the reel by loosening three thumb screws; they are interchangeable so that one may be carried by each field engineer and used with any reel.

The Nelson and the Saskatchewan are two of the largest rivers metered; on each of these there are Boat Stations. The velocities being high, it has been found that a canoe does not afford a steady enough working platform. The method now employed is to secure two canoes together parallel to one another by means of three pieces of oak laid across the gunwhales and bolted to the thwarts at each end, thus forming a kind of catamaran; a bridle is then fastened to the bows of the canoes and a line led from the centre of this bridle to the tag line stretched across the river. The meter may be suspended between the canoes or over either side by means of the metering board used on boat sections. The board described in the Annual Report for 1913-14, Plate 9, has been modified to permit of its use with the counting device. This modified form of the metering board is fully illustrated below.



Metering Board for Boat Station.

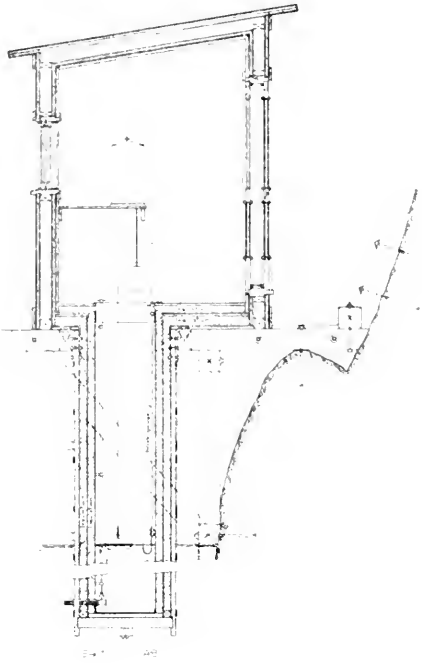
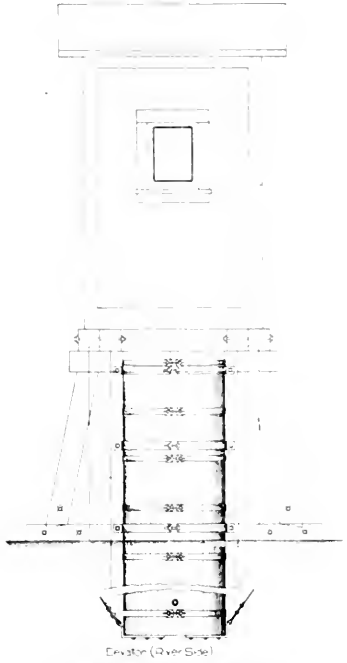
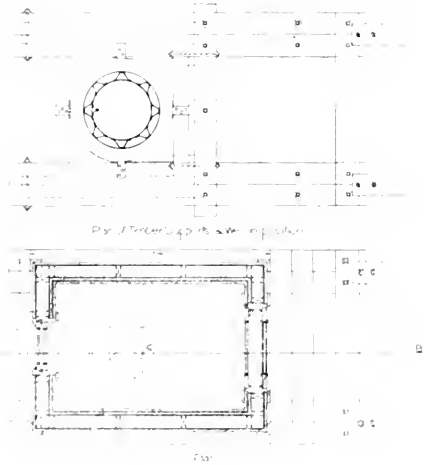
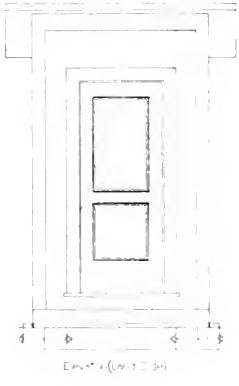
2. Suspension cable.
3. Handle of drum.
4. Automatic depth register.
5. Battery.
6. Telephone sounder.
7. Connection plug.

PLATE No 2









DOMINION WATER POWER BRANCH

MANITOBA HYDROMETRIC SURVEY

CONSTRUCTION DETAILS OF

TYPICAL AUTOMATIC GAUGE HOUSE

In making soundings at stations where considerable depths are encountered, considerable difficulty is always experienced in determining within close limits when the bottom is reached by the sounding weights. An attachment has been devised by Mr. Ireland for use with the meter bar in sounding, the meter being removed in such case: by means of the device an electrical contact is made when the weight reaches the bottom, the contact being announced in the ear piece the same as when metering. See illustration of metering board on page 11. Good results have been obtained with this, especially when used in sounding the larger streams, and also at the "Cable carrier" stations where the sag in the cable span formerly influenced the results.

A device which has been found very useful and for which we are indebted to the Engineers of the Water Resources Division, United States Geological Survey, for kindly sending samples and placing the same at our disposal, is used in making connection between the meter bar and the suspension cable. It has been used throughout the work of the last year and has, after a few minor changes, given complete satisfaction.

INSTALLATION OF EQUIPMENT.

AUTOMATIC GAUGES.

During the year a number of automatic gauges have been used. They are of two types, the Gurley Printing, of which four have been installed and preparation made for the fifth, and the Gurley Seven Day Stage Register, of which two were used. The four of the first type have been installed at permanent stations and considerable care has been exercised in erection to ensure as far as possible their operation during the Winter season with minimum attention. (See plate No. 2.) The permanent installations are at the following points:—

The first one was installed in February, 1915, on the public dock at Kenora; the gauge registers the Lake of the Woods levels at that point. The gauge readings are referred to Canadian Geodetic Levels Datum, the Canadian Geodetic Bench Mark on the Kenora Post Office being used for the purpose.

The second was installed in the control dam at the head of the Pinawa Channel. It records the water levels above the control dam, the gauge readings being referred to W.P.S. datum. This gauge was placed in operation in May, 1915.

The third installation is at Slave Falls and will be used for rating the discharge at that point, being placed on the left side of the river about two hundred feet above the metering station. The gauge is referred to W.P.S. datum, a permanent bench mark being placed near the gauge. The gauge began operation in June, 1915.

The fourth automatic gauge was installed at the head of Whitedog falls on the Winnipeg river; by means of this installation it will be possible to rate both the North and South Channels at that point. The datum of the gauge is W.P.S. datum, being tied in to a permanent bench mark placed near the gauge. This gauge was put in operation in August, 1915.

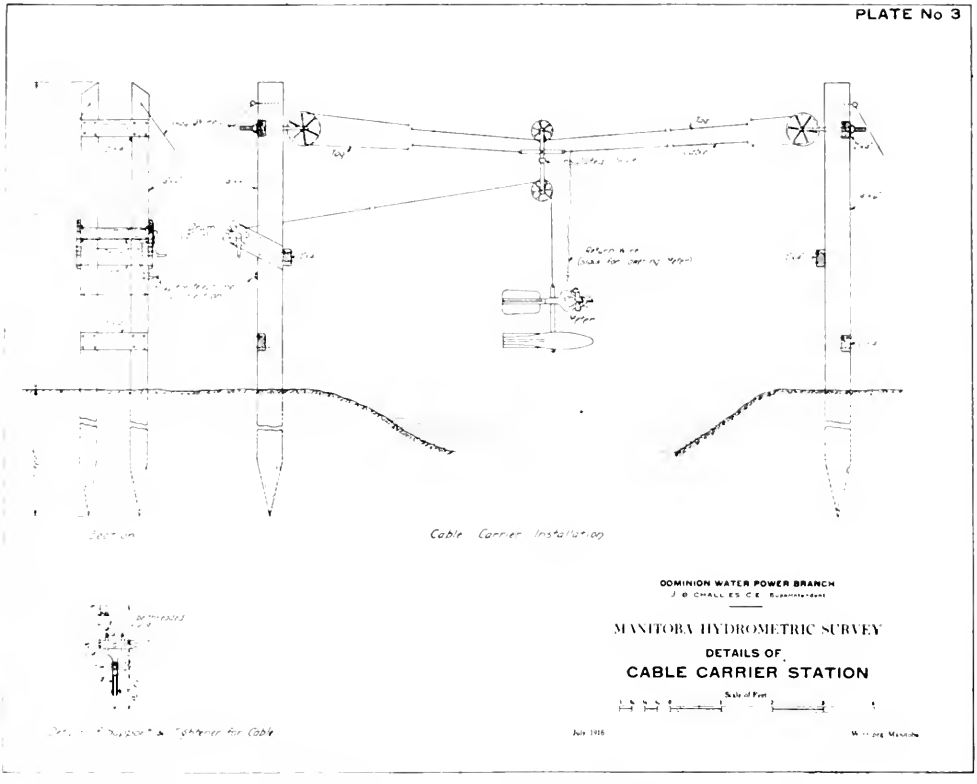
The material for the fifth installation has been purchased and is now at the site. This will be at the Hudson's Bay Post at Lac Seul. As this lake forms one of the largest natural storage basins on the Winnipeg river drainage system, it is considered advisable to install a gauge at the point named.

The two seven day gauges were used in connection with the hydrometric studies of the Nelson river near Manitou rapids. They were only temporarily installed and were removed at the end of the season's work. The zero of each gauge was, however, referred to two permanent bench marks which were tied together by a line of levels, also to the Hudson's Bay Railway datum.

CABLE STATIONS.

During the year two new cable stations were built, one at the head of the Pinawa Channel and the other at the South Channel, Whitedog falls. The station at Slave falls was also overhauled and certain repairs and renewals made.

New cable carrier stations were placed at the North Channel of Whitedog falls on the Winnipeg river and at Stuartburn and Dominion City on the Roseau river. (See plate No. 3 below).



The apparatus at the Bridge Station on the Saskatchewan river at Pas was also overhauled and repaired.

ACKNOWLEDGMENTS.

The Survey is indebted to the officials of a number of corporations for co-operation in obtaining records and for placing the results of various observations made by their own staff at the disposal of the Survey. The officials to whom acknowledgment is due are those of the Winnipeg Electric Street Railway, the Winnipeg Municipal Plant, the Lake of the Woods Milling Company and the Kenora Municipal Plant.

PROGRESS REPORT

OF THE

MANITOBA HYDROMETRIC SURVEY

FOR

THE CALENDAR YEAR, 1915

PART II

HYDROMETRIC DATA

PART II.

HYDROMETRIC DATA.

LAKE OF THE WOODS OUTLETS.

The outflow from the Lake of the Woods into the Winnipeg river below the lake is through several natural and artificial channels. The flow through all these outlets is controlled by the operation of hydraulic plants or the manipulation of dams. The outlets from the lake in order from the east are—Eastern Outlet, completely controlled by the Municipal Power Plant of Kenora: the Western Outlet, upon which has been built the Norman Dam; the head race of Mill "C," Lake of the Woods Milling Co., an artificial outlet: the head race of Mill "A" belonging to the same Company, and also an artificial channel, and last, the artificial head race of the Keewatin Lumber and Manufacturing Co.'s plant which was formed by an old high water channel that discharged into Mink Bay which in turn drains into Darlington Bay,. an arm of the Winnipeg river.

Below the outlets the Winnipeg river is split up into a number of branches, the tail races of Mills "A" and "C," the outlet of Darlington Bay and the Western Outlet forming the West Branch, and river below the Eastern Outlet forming the East Branch. These unite below Old Fort Island to form the main river.

The manipulation and operation of the dams and plants at the various outlets renders it difficult to ascertain the discharge from the Lake of the Woods. In order that correct estimates may be made it has been necessary to establish and operate a number of metering stations and maintain gauges at various points in the district. The location of the metering stations are as follows:—

1. Eastern Outlet, above the Kenora Power House.
2. Western Outlet, Norman Traffic Bridge.
3. Head Race Mill "C."
4. Head Race Mill "A."
5. Head Race, Keewatin Lumber & Manufacturing Co.
6. C.P.R. Culvert, Outlet of Mink Bay.
7. North Tunnel Island Station.

In addition to the records obtained at these regular stations, observations of the discharge at different controlling sections below the outlets have been made from time to time.

EAST BRANCH WINNIPEG RIVER, KENORA POWER HOUSE.

HISTORY.

The discharge of the East Branch, or Eastern Outlet, Lake of the Woods, depends upon the operation of the Kenora Municipal Power Plant. To determine the discharge under these circumstances it was necessary to rate the Power Plant. At first an attempt was made to determine the discharge directly, and to this end a station was established by Mr. S. S. Scovil, June 27, 1912, about one-half mile below the Power House near Old Fort Island, this proved unsatisfactory so a station was established by A. Pirie, October 8, 1913, about one hundred and fifty feet above the Power House in the Eastern Outlet. This section was used to rate the power station.

LOCATION OF SECTION.

The metering station is about one hundred and fifty feet above the Kenora Power House on the Eastern Outlet of the Lake of the Woods. The B.P. is located on the bank and is marked by an iron bolt set in the rock.

RECORDS AVAILABLE.

Daily gauge height readings are available for the head-and tail race of the plant from August 21, 1907, and daily estimates of discharge based upon the load upon the plant are available for a like period.

DRAINAGE AREA.

As in the case of the other outlets of the Lake of the Woods, the drainage area above, for the individual outlets is not significant.

GAUGE.

The tail-race and head-race gauges were established at the Power Plant in 1907, and are the ones used in the records until 1912, when on June 24 and 27, head-and tail race gauges were respectively established by Mr. Scovil, the former being on the upstream side of the timber platform in the head race and the latter two hundred feet below the power house. Both were referred to W.P.S. datum.

CHANNEL.

The channel is permanent, being in solid rock and boulders, is fairly uniform and free from cross eddies. It is straight for fifty feet above the section and one hundred feet below and fairly uniform. All the water passes through the power house except for a small part escaping in the log chute.

DISCHARGE MEASUREMENTS.

Sufficient measurements were made to rate the station under the range in loads and heads occurring, and a rating curve of load-discharges constructed for various heads. A boat station is used for the measurements.

ACCURACY.

Except for conditions due to small loads the rating may be considered good.

WESTERN OUTLET AT NORMAN TRAFFIC BRIDGE

HISTORY.

Station was established on June 5, 1912 by S.S. Scovil.

LOCATION OF SECTION.

The section is located on the downstream side of the Norman Traffic Bridge which spans the western outlet of the Lake of the Woods about two miles west of Kenora on the highway leading from Kenora to Keewatin. The Initial Point is marked on the wooden hand rail at the west end of the bridge, the meterings being taken from the deck.

RECORDS AVAILABLE.

Estimates of daily discharge are available for this station from May 1, 1913, and are based upon gauge readings taken at the D.P.W. Forebay gauge, Norman Dam, from May 1 to August 25, 1913, and from August 26, 1913 on, the gauge heights are those recorded by the Manitoba Hydrometric Survey gauge above the Norman Dam.

DRAINAGE AREA.

The drainage area above this section is 26,400 square miles, but owing to the fact that there are several other outlets of the Lake of the Woods this drainage area should not be used in computing run-off.

GAUGE.

When the station was first established a reference point was marked on the northeast corner of the west pier of the bridge to which water levels at the time of metering were referred. This was later replaced by a vertical staff gauge which was referred to W.P.S. datum.

Owing to the fact that the discharge past this section depends entirely upon the operation of the Norman Dam, the discharge measurements have been referred to the gauge height at that point, and daily discharges are also referred to the same gauge. Two gauges were

established above the Norman Dam, the first being that of the Ontario D.P.W. gauge which was used until the 25 of August, 1913. On the 26 of August, 1913, a vertical staff gauge was established by the Manitoba Hydrometric Survey which was referred to the W.P.S. datum.

CHANNEL.

There is but one channel for all stages of the river, the average depth over the section being approximately forty feet under normal conditions. The bed of the river is loose rock and boulders but is not subject to appreciable change. The velocity of the section is fairly high and some eddies are formed due to the section being located at the apex of a curve.

DISCHARGE MEASUREMENTS.

287 discharge measurements have been made at this station, but owing to the fact that the water at this point is practically at lake level, the range in stage has not been great, amounting to 2.2 feet.

ACCURACY.

The Norman dam which is located about four thousand feet below the station forms the control and the discharge is therefore dependent upon the manipulation of that dam; considerable range in discharge may occur for the same gauge height recorded at the section.

Discharge Measurements of Western Outlet, Lake of the Woods at Norman Traffic Bridge, 1915

SESSIONAL PAPER No. 25f

MONTHLY DISCHARGE OF WESTERN OUTLET, LAKE OF THE WOODS AT NORMAN TRAFFIC BRIDGE FOR 1915.

[Drainage area 26,400 square miles.]

MONTH	DISCHARGE IN SECOND-FEET				RUN OFF	
	Maximum.	Minimum.	Mean	Per square mile	Depth in inches on Drainage Area.	Total in acre-feet
January	7,770	7,431	7,622			468,700
February	7,698	7,522	7,650			424,900
March	7,579	7,427	7,470			459,300
April	14,101	7,343	12,115			720,900
May	21,702	13,428	16,209			996,700
June	20,051	16,768	17,850			1,062,200
July	24,254	21,978	23,138			1,422,700
August	23,690	10,823	18,317			1,126,240
September	11,058	9,283	10,244			609,500
October	8,522	6,676	7,290			448,200
November	7,264	6,618	6,882			409,500
December	7,645	6,635	6,945			427,000
The Year	24,254	6,618	11,811			8,575,800

NOTE.—Discharge per square mile and run-off depth in inches omitted. The outlet is one of several from the Lake of the Woods.

MILL "A" HEADRACE, KEEWATIN.

HISTORY.

The station in the Headrace Mill "A" was established by Mr. S. S. Seovil, December 23rd, 1912. This channel has formed one of the outlets of the Lake of the Woods since the Mill was built in 1887. A gauge in the Tailrace was operated from May, 1896, until June, 1912, when it was discontinued.

LOCATION OF SECTION.

The section as first located in the Headrace of Mill "A" was on the downstream side of the foot bridge across the channel. Later it was changed to a position just above the intake racks of the power house in the headrace Mill "A" Lake of the Woods Milling Co., Keewatin, Ont.

RECORDS AVAILABLE.

Intermittent gauge readings in the tailrace from 1896-1912 and from 1913 daily discharge records based upon meterings, head-and tail-gauge readings and loads on the Mill are available.

DRAINAGE AREA.

Total drainage area above the Lake of the Woods outlets is 26,400 square miles.

GAUGE.

A staff gauge has been placed on the metering section close to the right side of the channel. This gauge is referred to a W.P.S. B.M. located about 20 feet west of the gauge

CHANNEL.

The entrance to the racks is uniform and the section is well situated to avoid eddies of entrance, the stream line being generally perpendicular to the section.

DISCHARGE MEASUREMENTS.

A number of meterings have been made to determine the discharge for different gate openings and head so that the daily discharge may be arrived at. They are made from the rack structure.

ACCURACY.

The records are reliable owing to the conditions controlling the discharge, i.e., gate opening, head, etc., being easily observed.

SESSIONAL PAPER No. 25f

MILL "C" HEADRACE, KEEWATIN.

HISTORY.

The station was established on July17, 1912, by Mr. S. S. Scovil, when the first metering was taken by this Survey.

LOCATION OF SECTION.

The section is located about five feet upstream from the racks in the head race of Mill "C," Lake of the Woods Milling Co., leading from Portage Bay, an arm of Lake of theWoods at Keewatin, Ont. The initial point is marked on the east bank of the channel above the racks.

RECORDS AVAILABLE.

The records of discharge are based upon meterings and gauge heights in the head and tail race and also depend upon the load on the Mill. The daily discharges through the Mill are available for 1912-13-14-15.

DRAINAGE AREA.

This channel forms one of the outlets of the Lake of the Woods, and in consequence the drainage area above has no particular significance. It is however 26,400 square miles.

GAUGE.

The gauge is a vertical staff gauge placed on the east side of the channel about ten feet upstream from the racks. The zero of the gauge is referred to W.P.S. datum, the reference B.M. being a point on the top of the flume.

CHANNEL.

The channel is rectangular, cut in solid rock and has a normal depth of twelve feet. It is straight for about fifteen feet above the section.

DISCHARGE MEASUREMENTS.

The meterings are made from a small bridge spanning the channel and have been taken periodically from July 17, 1912, the range in stage covered being about 2½ feet.

ACCURACY.

The station gives good records but the daily discharge depends upon the gate openings on the turbines so that after rating the station to these, the records are reliable.

DISCHARGE MEASUREMENTS OF MILL "C" AT HEADRACE, LAKE OF THE WOODS MILLING CO., 1915.

KEEWATIN LUMBER & MANUFACTURING CO'S HEADRACE, KEEWATIN, ONT.

HISTORY.

This channel forms one of the outlets of the Lake of the Woods. It was created and used in connection with the above Company's mill, the discharge being controlled by the headgates. After the mill was burned in 1903 these fell into disrepair and leakage occurred; to ascertain this a station was established on December 13, 1913, by S. C. O'Grady and has since been operated.

LOCATION OF SECTION.

The metering section is on the upstream side of the bridge crossing the channel 300 feet above the power house and east of the headgates at the K.L. & M. Co.'s. headrace. The I.P. is a notch cut in the plank floor at the north end of the bridge and marked, "0+00."

RECORDS AVAILABLE.

The daily discharge records are available at this point since the establishment of the station in December, 1913.

GAUGE.

There is no gauge at this point, but the meterings are referred to the lake gauge at the Keewatin bridge where daily records are available.

CHANNEL.

The channel is fairly permanent, composed of clay and rock. It is straight for 150 feet above and 100 feet below the section. The current is not swift and depends upon the leakage at the gates.

DISCHARGE MEASUREMENTS.

Discharge measurements are taken frequently to check the leakage through the headgates, and as this control is fairly permanent the discharge depends largely upon the lake stage. No curve has been plotted for the station but the daily estimated discharge is based upon the meterings. The measurements are made from the bridge.

ACCURACY.

The accuracy may be considered good.

DISCHARGE MEASUREMENTS OF HEADRACE, OLD K.L. & M. CO. AT 2ND BRIDGE, 1915.

November	172	103	130			7,750
December	161	145	152			9,350
The Year	280	63	166			120,350

NOTE.—Discharge per square mile and run-off depth in inches omitted. The outlet is one of several from the Lake of the Woods.

C.P.R. CULVERT AT MINK BAY.

HISTORY.

This channel is a tunnel excavated in solid rock under the C.P.R. embankment and connects Mink Bay and Darlington Bay, the latter being an arm of the Winnipeg river. The station was established on July 29th, 1912, by S. S. Scovil, and has since been continuously maintained.

LOCATION OF SECTION.

The section is about 25 feet above the entrance to the tunnel which is about 2,000 feet west of the Old K.L. & M. mill on Mink Bay and forms the outlet for that bay into Darlington bay. The I.P. is a stake driven in the bank at the west side of the channel about 25 feet above the mouth of the tunnel.

RECORDS AVAILABLE.

Meterings have been made at close intervals from July 29, 1912, but no gauge heights are available, so no discharge curve has been constructed.

DRAINAGE AREA.

Not significant as most of the water flowing past this station is leakage through the K.L. & M. Co.'s head gates from Lake of the Woods.

GAUGE.

No gauge has been installed, water levels at the time of metering being obtained by measuring down from a point of rock which is referred to W.P.S. datum.

CHANNEL.

The channel is a rock cut and is constant in section above and below point of metering.

DISCHARGE MEASUREMENTS.

The meterings are taken by Price meter from a plank bridged across the channel.

ACCURACY.

The results obtained are good as the governing conditions are constant. No attempt has been made to obtain the daily discharges from daily gauge heights.

DISCHARGE MEASUREMENTS OF C.P.R. CULVERT AT 1ST TUNNEL WEST OF KEEWATIN, 1915.

WAR EAGLE OUTLET.

HISTORY.

The station was established by Mr. S. S. Scovil on July 29, 1912.

LOCATION OF SECTION.

The station is situated at downstream end of the culvert under the C.P.R. embankment on the outlet of War Eagle lake about ¼ mile below the lake and near Darlington bay into which it empties. The I. P. is marked on the rock forming the R. side of the channel at the mouth of the tunnel.

RECORDS AVAILABLE.

A number of meterings have been made during the period 1912-1913 but no gauge records have been kept.

DRAINAGE AREA.

The area tributary is about 50 square miles.

GAUGE.

No gauge has been established but the elevation of the water surface is obtained by measuring down from a fixed point marked on the rock near the section.

CHANNEL.

The channel is straight for 20 feet above the section and 60 feet below. The section is fairly uniform, being an artificial rock-cut.

DISCHARGE MEASUREMENTS.

The meterings are made from a plank bridged from side to side of the channel.

ACCURACY.

As only a few discharge measurements have been made covering a very narrow range in stage, no estimate has been made of daily discharge.

DISCHARGE MEASUREMENTS OF WAR EAGLE OUTLET NEAR KEEWATIN, ONT., 1915.

NORTH TUNNEL ISLAND.

HISTORY.

The station at North Tunnel Island was established on June 28, 1912, by Mr. S. S. Scovil.

LOCATION.

The meter section is on the west branch of the Winnipeg river on the north side of Tunnel Island about one mile below the Keewatin River Bridge. The I.P. of the section is chiselled in the rock on the south bank of the river and is painted "I.P. W.P.S. El. 1039.88."

RECORDS AVAILABLE.

Frequent discharge measurements have been made since the establishment of the station and daily discharges have been estimated for this section from the year 1907 to date.

DRAINAGE AREA.

The drainage area lying above this section is 26,400 square miles, but all of the water coming from this basin does not pass this section as part of it goes through the east branch of the Winnipeg, the two, the east and the west branch joining a short distance below the section.

GAUGE.

A vertical staff gauge reading to 10ths is located on a pile bent at the south end of the Keewatin River Bridge and to which all measurements at the station are referred. The zero of the gauge is referred to W.P.S. datum.

A vertical staff gauge read during metering is located on the north shore about 30 feet above the meter section and is bolted to the rock. It is referred to W.P.S. datum.

CHANNEL.

The river at this point is confined to a single channel at all stages, the bed of the stream is solid rock or boulders and of a very permanent nature, the banks are high and rocky and the river is confined to its channel at all stages. The approach to the section is straight for 100 feet and maintains the same direction for approximately 100 feet below, the cross section being approximately uniform over that distance.

DISCHARGE MEASUREMENTS.

Numerous discharge measurements have been taken at this station and cover a range in stage of 6·3 feet. Owing to the fact that part of the water flowing past this section enters the river through the Lake of the Woods Milling Company's plants which discharge into Darlington bay, and part of the water is discharged through the Norman Dam on the western outlet of the Lake of the Woods, the conditions governing discharge at this point vary from time to time and considerable difficulty is experienced in arriving at the daily discharge by means of a discharge curve, the ponding effect in Darlington bay having a very noticeable effect.

ACCURACY.

Owing to the presence of the mills and the operation of the Norman Dam the accuracy of the records is considerably affected.

WINNIPEG RIVER AND TRIBUTARIES.

WINNIPEG RIVER.

The Winnipeg river is one of the most important in the province of Manitoba, forming the source of a power supply for the city of Winnipeg. It joins Lake of the Woods to lake Winnipeg flowing in a westerly direction. The drainage area of this river is 53,500 square miles above the mouth. The basin has all the characteristics of the Laurentian formation, being dotted with lakes, ponds and muskegs. A considerable portion of the basin is composed of lake areas the size of which range between a few square miles up to 1,500 square miles, the latter being the surface area of the Lake of the Woods. The country drained is rough and more or less timbered. The upper part of the area has been lumbered to a considerable extent and still affords a field for such industry.

The river itself is of considerable proportions, and its characteristics are lake-like expanses joined by short stretches of swift water or falls. On account of these features splendid opportunity is offered for the development of water power. At the present time advantage has been taken of these possibilities in two cases, and developments are to be found at Point du Bois, where the city of Winnipeg has a municipally owned and operated plant, and on the Pinawa Channel where the plant of the Winnipeg Electric Railway Company is in operation. A number of other sites are capable of economic development and it has been estimated that a total output of approximately 420,000 continuous 24 hour horsepower is available from this river within the province of Manitoba from the regulated river.

In consequence of the importance of this river a number of stations at which records of discharge have been obtained have been established. They are as follows:—

1. The Dalles.
2. Throat Rapids.
3. Minaki.
4. Whitedog Rapids.
5. Slave Falls.
6. Otter Falls.
7. Pinawa Channel.
8. Grand du Bonnet Falls.

At some of these points continuous discharges are not available, the records being confined to a few isolated meterings.

TRIBUTARIES.

The tributaries of the Winnipeg river are, with one exception, of minor importance, having for the most part small drainage areas. This exception is the English river with a drainage area of 21,500 square miles, entering the Winnipeg from the north just within the province of Ontario. The other tributaries of the Winnipeg river are the Whiteshell river which joins the main river in the lake-like expanse known as Jessie lake, the Whitemouth which enters just below the Seven Sisters rapids and the Bird river which flows into Lac du Bonnet.

Of these tributaries, the Whitemouth is the only one for which daily records of discharge are available.

WINNIPEG RIVER AT MINAKI.

HISTORY.

The station was established by C. O. Allen on September 23, 1913. Later it was abandoned for the Whitedog station, difficulty being experienced in operating the station under winter conditions.

LOCATION OF SECTION.

The section is located on the downstream side of the G.T.P. Railway bridge $^3/_4$ mile east of the Minaki station and $^1/_4$ mile downstream from the Holst Point Hotel. The I.P. is marked by three spikes driven in the guard rail at the west end of the bridge on the downstream side.

RECORDS AVAILABLE.

A daily gauge height record has been kept since September 24, 1913. A number of meterings have been taken but there is not sufficient data to construct a rating curve for the station.

DRAINAGE AREA.

The drainage area above Minaki is 27,000 square miles.

GAUGE.

A vertical staff gauge 6 feet long is fastened to a plank which is spiked to crib work a the east end of the bridge and is 30 feet downstream from the section It is referred to three B.M.'s set to W.P.S. datum.

CHANNEL.

It is straight for 500 feet above the station and 1,000 feet below. The channel is divided by a pier of the bridge which stands in the river about 65 feet from the east shore. The stream is moderately swift but the bed of the stream is not liable to shift. It is confined to the two channels under all stages.

DISCHARGE MEASUREMENTS.

They are made from the bridge deck, the intervals being marked on the guard rail.

ACCURACY.

The channel forms a connecting link or strait between two lake-like expanses; on this account the discharge does not always bear the same relation to gauge heights, the ponding effect below being noticeable. A discharge curve for the station has not been constructed.

WHITEDOG FALLS, NORTH AND SOUTH CHANNELS.

HISTORY.

On May 18, 1914, a metering station was established on the South channel at Whitedog falls by S. C. O'Grady. This station was operated as a boat station until the end of July 1915, when the section was moved upstream approximately 100 feet and a cable station installed.

On May 23, 1914, a cable carrier station was established on the North channel of Whitedog falls, since which date this station has been in operation.

LOCATION OF SECTION.

The section on the South channel is located about 900 feet above the second falls and is reached either by canoe and a short portage at the first falls or by the road and trail on the large island, leading from the H.B. Co. old warehouse at the head of the first falls.

The I.P. is a cross and circle painted on the rock at the base of the tower and marked "I.P." with white paint.

The section on the North channel is located about 20 feet above the head of the first falls. The I.P. is a white arrow painted on the solid rock on the right bank of the channel.

RECORDS AVAILABLE.

The discharge measurements were taken since the establishment of the stations and are referred to the gauge at Minaki which has been operated since September 24, 1913. Daily discharge records are available since that date. The discharges of these stations must be combined to give the total discharge of the Winnipeg river at that point.

DRAINAGE AREA.

The drainage area above the section is 27,500 square miles.

GAUGE.

The gauge on the South channel is a vertical staff gauge bolted to the rock on the left bank, eighty feet below the section; it reads direct.

On the North channel a vertical staff gauge is bolted to the rock on the right bank about forty feet above the section; it is referred to B.M. placed in the solid rock across the stream at the head of the portage. Owing to the impossibility of getting a gauge reader at these sections, all meterings are referred to the gauge at Minaki, which has been read daily since September, 1913.

In August of 1915, a Gurley Water Stage Register with printed record, was set in place at the head of these falls and the records as obtained by this register are available.

Taken by M. C. Hendry.

WINNIPEG RIVER—WHITEDOG FALLS—
AUTOMATIC GAUGE HOUSE.

Taken by W. J. Ireland.

WINNIPEG RIVER—WHITEDOG FALLS—CABLE STATION—
SOUTH CHANNEL.

CHANNEL.

The South channel is approximately 400 feet wide and is composed of rock and not subject to shifting, the control for the section being the crest of the falls 900 feet below. The banks are high enough to ensure that under flood conditions no overflow will occur. The channel is straight and free from eddies under nearly all conditions.

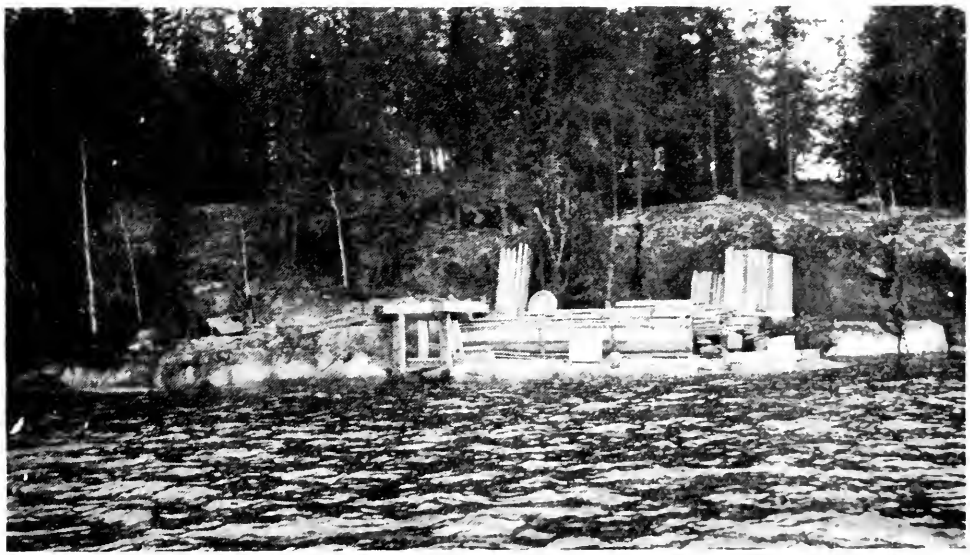
The North channel is much narrower. It is also composed of clay and solid rock and free from likelihood of shifting, the control being 50 feet below. The channel is straight both above and below the section for a sufficient distance to ensure freedom from eddies.

DISCHARGE MEASUREMENTS.

Sufficient meterings have been made to define the discharge curve over a range of 3'0 feet. Forty-six in all have been taken on the North channel, while thirty-five have been taken on the South channel.

ACCURACY.

The discharge curve is well defined between gauge heights 1033 and 1036 W.P.S datum; above and below those heights the curve is only fairly well defined.



Taken by W. J. Ireland.

Note.—Marked thus [1] Estimated. This table gives the total combined discharges, Run-off, etc. for the North and South Channels at Whitedog Falls.

WINNIPEG RIVER AT SLAVE FALLS.

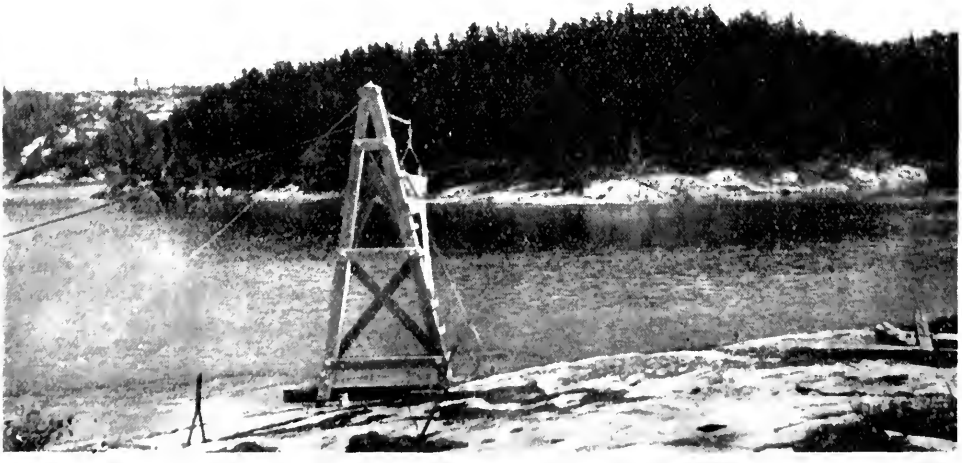
HISTORY.

A number of meterings of the Winnipeg river were made by various interested parties between March, 1906, and October, 1911. These have all been referred to gauge heights in the tailrace of the City of Winnipeg Plant at Point du Bois, though they were taken at various points on the river. On October 1, 1911, a metering station was established at Slave falls by D. L. McLean. This is a cable station and has been operated on all measurements taken at this point since the above date. All meterings to the end of 1914 are referred to the gauge in the tailrace at Point du Bois.

In June of 1915 a Gurley automatic water stage register was established above Slave falls. A relation between this gauge and the Point du Bois tailrace gauge has been obtained and all records for this station for the year 1915 refer to the stage at Slave falls.

LOCATION OF SECTION.

The metering section is located about two hundred and fifty feet above the crest of the Slave falls, which is about four miles below the City of Winnipeg's plant at Point du Bois. The I.P. is a chisel mark on the rock marked by paint, on the right bank near the cable carrier.



Taken by W. J. Ireland.

WINNIPEG RIVER—SLAVE FALLS—NEW TOWERS FOR METERING STATION.

Taken by W. J. Ireland.

WINNIPEG RIVER—SLAVE FALLS—AUTOMATIC GAUGE HOUSE.

RECORDS AVAILABLE.

By referring the meterings made to the Point du Bois gauge, continuous records of daily discharge have been computed from January of 1907 to the end of 1915.

DRAINAGE AREA.

The drainage area above Otter falls is 50,500 square miles, and above Slave falls the area is 49,700 square miles.

GAUGE.

A vertical staff gauge is located about seventy-five feet downstream from the section on the right bank. This gauge is referred to B.M. 189 A; a rock bench mark situated about twenty feet from the gauge.

The automatic gauge referred to above is located about four hundred feet above the meter section on the left bank, and is referenced to a brass cap bench mark bolted to the rock about thirty feet upstream from the gauge house.

CHANNEL.

The channel is straight for one hundred feet above and one hundred and fifty feet below the gauge at nearly all stages. The bed is of solid rock with a few large boulders at the left side of the section. It is permanent and all the water at all stages is confined to the section.

DISCHARGE MEASUREMENTS.

Discharge measurements have been taken covering practically the complete range in stage recorded since the establishment of the station. These measurements are made from a car travelling on a cable spanning the river at the section.

ACCURACY.

The discharge curve is well defined over the range in gauge height, both when plotted to the Slave falls and Point du Bois gauges. On account of the drop at the falls below the station there is no possibility of backwater effect. Also the section is an open water one at all seasons, so that the open water rating applies the year round. The section is a very favorable one and the accuracy of the records is high

Taken by W. J. Ireland.

PINAWA CHANNEL, BELOW CONTROL DAM.

HISTORY.

The Pinawa channel was a high water or back channel of the Winnipeg river, and was utilized as a diverting channel for a power house built about nine miles below the inlet by the Winnipeg Electric Railway Company. At first the plant depended upon the stage of the river for water down this channel, but the rapid growth of the load necessitated the building of a diverting dam in the main river to ensure sufficient flow down the Pinawa channel. Meterings were made below the control dam by engineers of the Company from 1907-1911. In May, 1912, a boat station was established on the Pinawa channel by Mr. A. M. Beale, for the purpose of collecting discharge data, and from that date records have been obtained at this station. In June of 1915 a cable station was installed to take the place of the boat station on practically the same section.

LOCATION OF SECTION.

The station is about two hundred feet below the control dam and six miles above the Winnipeg Electric Railway's plant on the Pinawa channel. The I.P. is a point chiselled in the rock on the left bank of the channel and referenced by a rock painted, "I.P."

RECORDS AVAILABLE.

A daily gauge record was obtained at the control dam by the Winnipeg Electric Railway Co. from April 28, 1906, to the end of 1914. The records are not continuous but cover the greater part of the period, and have been placed at the disposal of the Manitoba Hydrometric Survey. The records of a Gurley automatic water stage register installed by this Survey in June of 1914 are also available.

Daily discharge estimates based upon a curve plotted from discharge measurements taken between 1907 and 1911 are available. These cover the period of the years from May to October (the open water months). On account of back water due to ice jams in the channel below, estimates have not been made for the winter months.

GAUGE.

A vertical staff gauge bolted to the upstream side of the control dam was set in place by the Winnipeg Electric Railway Co., and it is this gauge to which records are referred. This gauge is referred to W.P.S. datum.

In May of 1915 a Gurley automatic water stage register was installed on the upstream side of the control dam close to the right bank, and from May 13 the records of this gauge are available. The gauge is referred to W.P.S. datum.

Taken by W. J. Ireland.

PINAWA CHANNEL—CABLE STATION BELOW CONTROL DAM.

CHANNEL.

The channel is straight for one hundred feet above the section and the same distance below; the section is regular, being a rock cut channel, the water being confined to the channel at all stages.

DISCHARGE MEASUREMENTS.

Discharge measurements have been taken at frequent intervals since the establishment of the station, numbering in all, sixty, and covering a range of four feet in gauge height.

DIVERSIONS.

All the water passing through the dam passes the section but there is a diversion channel just above the dam down which water may be diverted.

ACCURACY.

For the earlier years the discharge curve is well defined, but since the power station has been heavily loaded the load fluctuations may be noticed at the section making estimates of discharge rather susceptible to error.

DISCHARGE MEASUREMENTS OF PINAWA CHANNEL BELOW CONTROL DAM, 1915.

WHITEMOUTH RIVER.

The source of the Whitemouth river is in Whitemouth lake which lies in the South-eastern part of the province. The course of the river is generally North from the source to its junction with the Winnipeg river just below the Seven Sisters rapids on the latter stream.

The drainage area of the river is 1,566 square miles. The upper part of the river flows through that part of the country known as the Julius Muskeg, and as the name would imply is low and wet. The lower part of the valley is narrow, the land is fertile, and a considerable portion has been cleared and is now under cultivation. The lower two miles of the river flows through a well timbered belt of country, spruce, oak and poplar of merchantable size being plentiful.

The bed of the river is generally clay, but at the lower end rock ridges extend across the river bed and at one point form what is known as Whitemouth falls, which is near the mouth. The valley is generally from 30 to 50 feet in height, and the valley proper varies from 200 to 600 feet wide.

WHITEMOUTH RIVER AT WHITEMOUTH.

HISTORY.

The metering section was established at Whitemouth on the river of that name by G. H. Burnham on May 28, 1912.

LOCATION OF SECTION.

The station is located on the downstream side of the traffic bridge which crosses the river about nine hundred feet North-east of the C.P. Ry. station at Whitemouth. The I.P. is marked by three wire nails driven in the handrail of the bridge directly above the south abutment and the intervals are also marked on the handrail.

RECORDS AVAILABLE.

Daily gauge and discharge records are available from May 29, 1912, to the end of 1915 for the open water months. During the winters of 1912-13 and 1913-14 no gauge records were obtained, but during the winter of 1914-15 records are available.

DRAINAGE AREA.

The drainage area of the river above the station is 1,400 square miles. Much of this territory is low lying and of a swampy nature, lately it has been cross cut by the drainage system in connection with the construction of conduit for the Greater Winnipeg water supply, the Whitemouth being used as a discharge channel. This has noticeably affected the flow.

GAUGE.

A vertical staff gauge graduated to tenths is fastened to a pile of the bridge opposite station 91 of the section. It is referred to a B.M. consisting of an iron bolt sunk in a concrete pile near the bridge. An arbitrary datum is used.

CHANNEL.

The river is divided into six channels by the pile bents of the bridge. The bed is of clay and liable to slight shifting. The depth over the section under normal conditions averages four feet. The banks are not subject to overflow.

DISCHARGE MEASUREMENTS.

Sufficient meterings have been secured to define the discharge curve over a range of four feet in gauge height, for open water conditions. Under ice conditions a number have been taken but do not define the curve of discharge clearly. The measurements are made from the bridge.

ACCURACY.

The accuracy for the station curve is high over a range in gauge height of four feet, from 73·8 to 77·3.

NOTE.—Marked thus (1) Estimated.

RED RIVER AND TRIBUTARIES.

RED RIVER.

The Red river, one of the most important flowing in the province of Manitoba, has its source near the central part of the State of Minnesota. It flows south and west to the town of Breckenbridge, then north to the International boundary, forming the boundary in that stretch between the States of Minnesota and North Dakota.

The general direction of the river from Breckenbridge to lake Winnipeg, into which body of water the river empties, is North, though the river itself is very sinuous in its course, nearly doubling its length between the points mentioned.

The drainage basin of the river is 116,347 square miles, of which 42,547 are in Minnesota and Dakota, 50,500 in Saskatchewan and 23,300 in Manitoba.

The valley of the river is not defined by high banks as in most cases, but the whole country slopes gently toward the river, which lies in a channel cut to a depth of from 25 to 50 feet below the plain.

The valley of the Red river is the oldest settled district in the Province, the land being practically all settled and farmed. Little standing timber is to be found, only clumps of elm and ash with poplar and cottonwood being found along the river.

The stream afforded the first means of access to the country, and was navigated for a number of years before the advent of the railways to the country between Grand Forks and lake Winnipeg. This traffic has however practically ceased to exist except upon the stretch of the river between Winnipeg and the lake. The Dominion Government have built a dam and lock near the mouth of the river, and by operating it an eight foot depth for navigation purposes is ensured between the lake and the city of Winnipeg.

There are a number of important centres which are located along the river. Among those within the province of Manitoba are:—Emerson, which is just north of the International boundary. Winnipeg, at the junction of the Assiniboine with the Red, and Selkirk, about 22 miles below Winnipeg. In addition to these a number of small communities are located along the banks of the river.

Metering stations have been located from time to time and maintained for certain periods at the following points along the river in the province of Manitoba:—

1. At the C.N.R. bridge at Emerson.
2. Three miles below Emerson.
3. At Elm Park bridge in Winnipeg.
4. At Redwood bridge in Winnipeg.

TRIBUTARIES.

The tributaries of the Red which enter that river within the province of Manitoba or close to its boundaries are:—

Pembina river.
Roseau river.
Rat river.
Morris river.
Assiniboine river.
Seine river.

Of these the Assiniboine is the most important and is given a separate section in this report. The others are considered along with the Red river; they enter it in the order given from source to mouth. Records of discharge for the Roseau and Rat are fairly continuous, but for the others only isolated meterings are available and are therefore listed under the head of miscellaneous meterings.

In the case of the Pembina, note should be made that this river flows partly through United States territory. Records of its discharge were kept by the United States Geological Survey at Neche, North Dakota, during the years 1903 to 1910 inclusive, and were included in Water Resources Paper No. 4.

RED RIVER AT EMERSON.

HISTORY.

The station was established by S. S. Scovil on May 3, 1912, and has been operated steadily from that date.

LOCATION OF SECTION.

The section at the time of the establishment of the station was located on the downstream side of the C.N.R. bridge at Emerson. The I.P. was at the intersection of the end post of the bridge with the wooden handrail on the left hand end of the bridge on the downstream side.

In the spring of 1914, the old bridge was replaced with a new one. On this new bridge the section is located on the downstream side, the I.P. being located on the west side of the east abutment. This change moved the location of the section approximately twelve feet downstream.

RECORDS AVAILABLE.

Daily gauge height records have been kept for each open water season since the station was established and intermittent readings under winter conditions have been obtained for the same period. A discharge curve for open water and winter conditions has been constructed and from it estimates of daily discharge have been arrived at.

DRAINAGE AREA.

The area tributary to the river above this station is 34,600 square miles and practically all of it is south of the International Boundary.

GAUGE.

A nine-foot vertical staff gauge is secured to the sheet piling around the west pier, twenty feet upstream from the section and is used for the lower stages of the river. The records of the upper stage of the river are observed on a gauge placed on the east side of the ice breaker on the upstream side of the bridge. Both of these gauges are referred to a permanent M.H.S. B.M. located on the left bank of the river about sixteen feet upstream from the west bridge abutment. This B.M. is set to M.H.S. datum.

CHANNEL.

The channel is divided by the bridge piers, otherwise it remains the same under all conditions. The bottom is hard clay inlaid with gravel. It is straight for four hundred feet above the station and five hundred feet below. The banks are high and not subject to overflow except under extraordinary conditions. The floods of 1879, 1882 and 1897 overflowed the banks.

DISCHARGE MEASUREMENTS.

Measurements are taken from the downstream side of the bridge except under winter conditions when they are taken from the ice.

ACCURACY.

A range in stage under open water conditions of 26.16 feet is covered, the discharge curve being well defined between gauge heights 749.0 and 765.0, beyond these limits the definition is not so good. Under ice conditions a discharge curve is well defined between the limits 749.0 and 751.5.

Discharge Measurements of Red River at Emerson, 1915.

RED RIVER AT ELM PARK.

HISTORY.

The station was established by M. S. Madden on August 19, 1914, the object of establishing a station at this point was to secure some information regarding discharge with a view to making some determinations by slope measurements.

LOCATION OF SECTION.

The meter section is situated on the downstream side of Elm Park traffic bridge which crosses the Red river at Elm Park within the city limits of Winnipeg and about four and one-half miles above the junction of the Assiniboine and Red rivers. The I.P. of the section is marked on the wooden hand rail at the north end of the bridge on the downstream side.

RECORDS AVAILABLE.

Daily gauge height readings have been taken from August 19, 1914, on. A number of discharge measurements have also been secured.

The presence of the St. Andrews Dam in the Red river has a material effect upon the discharge measurements taken at this point, but one of the objects of establishing the station was to secure records over that period when the dam was opened. There have been no estimates made of daily discharge for this station.

DRAINAGE AREA.

The area tributary to the Red river above Elm Park bridge is 41,060 square miles.

GAUGE.

A nine foot vertical staff gauge was spiked to the wooden ice breaker opposite station 160 on the metering section. This was replaced on November 6 by a vertical staff gauge which was fastened to the concrete pier in midstream and just below the ice breaker. The gauge is referred to M.H.S. datum.

CHANNEL.

The channel is straight for 1,000 feet above the section and 1,500 feet below, the banks are high and not liable to overflow, the bed of the channel is composed of sand and clay and somewhat liable to shifting. The channel itself is divided into two channels by a centre bridge pier.

DISCHARGE MEASUREMENTS.

The discharge measurements are taken from the downstream side of the bridge.

ACCURACY.

Owing to the effect of the operation of the St. Andrews Dam, it has not been possible to construct a discharge curve for this station. Primarily the station was established with the object of making slope discharge experiments, under conditions obtaining when the dam was closed, but owing to the distance that the water is backed up beyond the station, sufficient fall could not be obtained in a stretch of several miles to render the results obtained at all reliable. When the dam is open the discharge measurements are quite reliable.

[1] Ice measurement.

RED RIVER AT REDWOOD BRIDGE, WINNIPEG.

HISTORY.

A gauge was set on the Red River at the Redwood bridge in the City of Winnipeg on August 21, 1912, by G. H. Burnham, in connection with the work of the Red River survey, and from that time intermittent gauge readings have been obtained at this point.

LOCATION OF GAUGE.

The Redwood bridge crosses the Red River on Redwood Ave. in the City of Winnipeg about three miles downstream from the junction of the Red and Assiniboine rivers.

The gauge is located inside the ice breaker and facing the upstream side of the bridge, and is referenced to a B.M. set to M.H.S. datum, on the top of the bridge pier adjacent to the gauge.

RECORDS AVAILABLE.

Intermittent gauge readings have been obtained on this gauge from the time of installation to the end of the year 1915.

RED RIVER AT MORRIS.

HISTORY.

A gauge was established on the Red river at the town of Morris on May 1, 1914, by A. Pirie, and from that date gauge readings have been obtained at this point.

LOCATION OF GAUGE.

A twelve-foot staff gauge has been secured to a rod driven into the bed of the stream at a point directly below the C.N.R. pump house on the left bank of the river and about six hundred feet below the pontoon bridge.

The gauge is referred to a permanent M.H.S. B.M. set to M.H.S. datum and located behind the C.N.R. pump house.

RECORDS AVAILABLE.

Continuous records of daily gauge readings have been obtained from the time of installation of the gauge, May 1, 1914, to November 21, 1915.

RED RIVER AT ST. AGATHE.

HISTORY.

A gauge was set on the Red river at St. Agathe by A. Pirie on May 1, 1914, and except during times of interference during high water records have been obtained since that time.

LOCATION OF GAUGE.

A nine-foot enamelled staff gauge has been secured to a rod driven into the bed of the stream close to the left bank, two hundred feet downstream from the ferry. The gauge is referred to a permanent M.H.S. B.M. set to M.H.S. datum and located at top of bank near the gauge.

RECORDS AVAILABLE.

Gauge records are available from May 1 to December 31, 1914, from January 1 to April 2, from May 10 to June 30, and from July 21 to November 12, 1915.

ROSEAU RIVER.

The Roseau river is the largest tributary entering the Red river from the east within the Province of Manitoba. The mouth of the Roseau is about 12 miles north of the International boundary and it drains the territory lying to the west and south of the Lake of the Woods.

The general direction followed by the Roseau is northwest, but the actual course of the river is very sinuous, about half of its length lying in United States territory. The banks of the river vary from ten to twelve feet in height and are cut sharply down from the prairie level. The river bottom and banks are composed chiefly of heavy clay.

The drainage area is 1,987 square miles, 890 square miles being in Manitoba and 1,097 square miles in the State of Minnesota. A large part of the drainage area is under cultivation, there being little standing timber in that part within the province. What there is consists mostly of elm, ash and oak, very little of which is of commercial size.

Considerable drainage work has been done in the basin, especially on the United States side of the line. There are no towns of any size to be found along the river, but three small villages are so located; these are Sprague, near the International boundary on the Ridgeville branch of the C.N.R., Stuartburn on the same line and Dominion City located at the crossing of the Emerson branch of the C.P.R. Dominion City has a population of about 200.

Discharge measurements have been made at various sections on the river since the establishment of the Survey in 1912. The sections were used and then abandoned in favor of more suitable ones for various reasons and are as follows:

1. At Dominion City.
2. At Baskerville's Farm.
3. At Mayne's Farm.
4. Below Dominion City, in use at present.

The records and results obtained at these stations follow.

ROSEAU RIVER AT STUARTBURN.

HISTORY.

On May 7, 1915, a metering station was established on the Roseau river at Stuartburn, Manitoba, by A. Pirie, and the station was operated throughout the open water season of that year.

LOCATION OF SECTION.

The station established by A. Pirie was located on the downstream side of the C.N. Ry. bridge about five hundred yards east of Stuartburn station. On June 6 a section was chosen two hundred and eighty-five feet downstream from the above mentioned bridge and at this point a cable carrier station was established. The Initial Point is a large permanent hub placed between the left bank cable support and the water's edge.

RECORDS AVAILABLE.

From the time of the installation of the gauge on May 7, continuous records of gauge readings are available up to November 15 of the same year, at which time ice cover conditions were met with.

Discharge measurements were taken at various times thoughout this period, covering a range in stage of 3·3 feet, and from these estimated daily discharges have been computed.

DRAINAGE AREA.

The drainage area tributary to the river at this point is 1,520 square miles.

GAUGE.

A nine-foot staff gauge secured to a two by four inch scantling driven into the bed of the stream near the left bank at the C.N.R. bridge. The gauge is referred to a permanent M.H.S. B.M. set to an arbitrary datum and located about sixty-five feet northwest of west end of bridge.

CHANNEL.

The bed of the stream is composed of sandy silt and liable to shift during flood. The banks at the section are high and not liable to overflow.

DISCHARGE MEASUREMENTS.

All discharge measurements since the discontinuance of the bridge station are made from a traveller suspended from a cable from which the meter is lowered into the stream at the points of measurement.

ACCURACY.

The discharge curve for the range in stage covered by the discharge measurements is fairly well defined.

NOTE.—Discharges marked thus (1) are estimated.

ROSEAU RIVER BELOW DOMINION CITY.

HISTORY.

The section at Baskerville's farm while satisfactory was considerably out of the route and entailed a drive of nearly eighteen miles. On April 14, 1914, the above station was established by D. B. Gow to supersede it.

LOCATION OF SECTION.

The station below Dominion City is about 2,000 feet below the C.P.R. bridge over the Roseau and about 2,100 feet below the C.P.R. dam on the river. The I.P. is a nail in an eight inch white ash tree blazed and near the top of the left bank.

RECORDS AVAILABLE.

A daily gauge height record has been kept since April 14, 1914, and sufficient meterings have been taken to define the discharge curve. Daily discharges have been computed for the station.

DRAINAGE AREA.

The drainage area is 1,940 square miles.

GAUGE.

The gauge is a vertical staff fastened to a two by four inch scantling driven into the stream bed and braced. It is located one thousand feet below the section and is nearer the town on account of the winding of the river.

CHANNEL.

There is only one channel at all stages. The bottom is fairly permanent, the banks are sloping and not subject to overflow. The channel is straight for three hundred and fifty feet above the section and for one hundred feet below.

DISCHARGE MEASUREMENTS.

Measurements are made by means of a cable carrier, the cable being stretched across the stream and the meterings are made by suspending the meter from it. The meterings cover a range in stage of five feet.

ACCURACY.

The discharge curve is well defined between gauge heights 87·00 and 89·00 and fairly well defined between gauge heights 89·00 and 92·70.

NOTE.—Discharges marked thus ([1]) are estimated.

THE RAT RIVER.

The drainage area of the Rat river from its source to its mouth comprises 997 square miles. The northern boundary of this area is formed by the watersheds of the Whitemouth and Seine rivers, while its southern limits consist of the northern slope of the watershed of the Roseau river.

The west branch of the river takes its rise in the country lying to the southeast of the town of Woodridge on the Ontario Branch of the Canadian Northern Railway, and is confined chiefly to Tp. 3, R. 11, E.P.M. The first ten miles of its course the river has a southwesterly bearing, from this latter point it flows northwest for about four miles, then nearly due south for three miles, then north for about six miles. This latter point lies about two miles east of the town of Zhoda, from this point it flows through a swampy and marshy country due west for about eighteen miles and then in a northwesterly direction to its mouth at the Red river.

The territory drained is generally flat prairie country, except in the upper reaches, where the land is inclined to be wet and swampy. Nearly all the drainage area is under cultivation, the settlement being about the oldest in the province.

RAT RIVER AT OTTERBURNE.

HISTORY.

The station was established by S. S. Scovil on May 23, 1912.

LOCATION OF SECTION.

The section is on the downstream side of the bridge which crosses the Rat at F. X. Joubert's farm, four miles from Otterburne by the C.P.R. and two miles from St. Pierre. The I.P. is marked by a spike driven in the south end of the downstream railing

RECORDS AVAILABLE.

A daily gauge height record has been kept for the open water periods from May 23, 1913, to date. During the winter periods an intermittent record has been kept and is available. Estimates of daily discharge have been prepared based upon the rating curve constructed from the meter records.

DRAINAGE AREA.

The area drained is 650 square miles. The basin lies between the Roseau on the south and the Seine and Whitemouth on the north and east.

GAUGE.

The gauge is a nine-foot vertical staff gauge secured to a pile sixteen feet from the left bank at the section. This gauge is referred to a permanent M.H.S. B.M. located about 30 feet southwest from the gauge. The B.M. is set to an assumed datum.

CHANNEL.

Above the station the channel is straight for two hundred feet and for one hundred feet below. There is one channel at all stages. The bottom is of clay and liable to shift.

DISCHARGE MEASUREMENTS.

Discharge measurements are made from the downstream side of the bridge. A range in stage of 8.4 feet has been defined on the rating curve. Under winter conditions it has not been possible to obtain a rating.

DIVERSIONS.

The C.P.R. has constructed a dam four miles below the metering station and use the pond created as a source of supply. Under low water conditions it is reported the company utilize the whole flow of the river.

ACCURACY.

From gauge height 88.30 to 92.40 the discharge curve is well defined, from 92.40 to 96.70 it is fairly well defined. It is not possible to define a discharge curve for winter conditions.

SEINE RIVER AT STE. ANNE DE CHENES.

HISTORY.

On October 4, 1912, a metering station was established on the Seine river near Ste. Anne des Chenes, but observations were discontinued on November 11 of the same year, and no further information was obtained at this point until May 1, 1915, when operations were again commenced in an endeavour to obtain a rating of the river.

LOCATION OF SECTION.

The Seine is a tributary of the Red river and joins same in the City of St. Boniface. The metering station is located about one mile east of the town of Ste. Anne des Chenes on the downstream side of the C.N. Ry. bridge at this point. The Initial Point is a bolt on the west end of the bridge.

RECORDS AVAILABLE.

Records of gauge readings are available from October 4 to November 11 for the year 1912, and from May 1 to November 12 for 1915. Estimated daily discharges are also available during the latter period based on discharge measurements covering a range of 3·3 feet.

DRAINAGE AREA.

The drainage area tributary to the river at this point is 310 square miles.

GAUGE.

A six-foot vertical staff gauge is secured to the fourth pile from the west end on the downstream side of the C.N. Ry. bridge. This gauge is referred to a B.M. located on the first telegraph pole west of the bridge.

CHANNEL.

The section is located at a slightly curved part of the river. The bed of the stream is sandy, and at all stages the flow of the river will be confined to the one channel covered by the section.

DISCHARGE MEASUREMENTS.

The discharge measurements at all stages of the river are taken from the bridge.

ACCUARCY.

The discharge curve is fairly well defined over the range in stage covered by the recorded gauge heights.

ASSINIBOINE RIVER AND TRIBUTARIES.

ASSINIBOINE RIVER.

The Assiniboine river is one of the chief tributaries of the Red river, joining the latter within the city limits of Winnipeg, rising in the province of Saskatchewan on the south-eastern slope of the Nut mountains. It flows in a southeasterly direction and crosses the Manitoba boundary in Tp. 26, R. 28, W.P.M., and thence nearly due south until it reaches Tp. 10, R. 25, W.P.M., where it turns and flows south and east to the Red river.

The principal tributaries of the Assiniboine are the Shell, Qu'Appelle, Little Saskatchewan and Souris rivers. The total drainage area is 59,550 square miles, of which 8,800 square miles are in the State of North Dakota, 37,700 square miles in the province of Saskatchewan and 13,050 square miles in the province of Manitoba.

The area drained varies between the open prairie to be found in the southwestern part of the province and the well timbered country lying on the slopes of the Duck and Riding mountains. In the prairie country the banks are sharp cut, rising abruptly from the water's edge for a height varying from three to twenty-five feet. In the wooded section or the upper part of the drainage area the valley is well defined and narrow, the rise from the river in some places reaching an elevation of two hundred and fifty feet above the water level.

In the lower part of the river basin the land is nearly all under cultivation, the soil is rich but in the valley bottom it is subject to overflow. It flows through the most densely populated part of the Province, the three largest cities, Portage La Prairie, Brandon and Winnipeg being built upon its banks.

The importance of this river as a source of water supply, a means of drainage and sewage disposal is great in a district where the natural water supply is somewhat limited. In order that a study may properly be made of its regimen and data for various purposes be gathered several gauging stations have been established. All have not been in continuous operation but discharge records have been obtained at the following places on the river:—

1. Millwood.
2. Brandon.
3. Headingly.
4. St. James.

TRIBUTARIES.

The tributaries of the Assiniboine river in order from source to mouth are:—

1. Shell river.
2. Qu'Appelle river.
3. Birdtail Creek.

4. Little Saskatchewan river.
5. Souris river.
6. Cypress river.

On all of these, with the exception of the Qu'Appelle river, records of discharge are available.

ASSINIBOINE RIVER AT MILLWOOD.

HISTORY.

The station on the Assiniboine river at Millwood was established by W. G. Worden on October 11, 1912, and has been in operation since that time.

LOCATION OF SECTION.

The meter section is located on the downstream side of the traffic bridge, four hundred feet below the dam, one-quarter of a mile south from the town and one-half mile below the C.P.R. bridge. The I.P. is an arrow cut and painted on the top of the wooden hand rail of the bridge at the northeast corner on the downstream side. It is marked "0+00 I.P."

RECORDS AVAILABLE.

Daily gauge height records are available for the station from October 11, 1912, to the end of 1915, except for the period February 9 to March 28, 1914. Estimates of daily discharge are available from January 27, 1913, to the end of 1915, except for the above period.

DRAINAGE AREA.

The area tributary to the Assiniboine river above the station is 7,590 square miles.

GAUGE.

A 12-foot vertical staff gauge is secured to the centre pier of the bridge on the downstream side; it is referred to a permanent M.H.S. B.M. located 75 feet southeast from the downstream side of the bridge on the left bank. This B.M. is set to an assumed datum.

Taken by T. H. Boyd.

ASSINIBOINE RIVER—MILLWOOD—BRIDGE FROM BELOW, SHOWING GAUGE.

CHANNEL.

For four hundred feet above the section and two hundred feet below the channel is straight. The river at all stages occupies one channel, which is divided just above the section by a central pier of the bridge. The bed of the stream is clay, sand and gravel and not subject to shifting. The banks are low and liable to overflow at high stages.

DISCHARGE MEASUREMENTS.

The discharge measurements are taken from the downstream side of the bridge and cover a range in stage under open water conditions of 8·3 feet.

ACCURACY.

Under open water conditions the discharge curve is well defined between the limits 98·91 and 107·4, beyond which it is not well defined. The discharge curve for ice conditions is fairly well defined between gauge heights 97·5 and 99·5.

NOTE.—Marked thus [1] estimated.

ASSINIBOINE RIVER AT BRANDON.

HISTORY.

The station on the Assiniboine at Brandon was established on July 4, 1912, by G. H. Burnham and has been operated since that date.

LOCATION OF SECTION.

The meter section is located on the downstream side of First Street traffic bridge, locally known as the Iron Bridge, in the city of Brandon, Manitoba. The I.P. is marked on the iron railing on the downstream side of the bridge at the south end.

RECORDS AVAILABLE.

Nearly continuous records of daily gauge heights are available from July 4, 1912, to the end of 1915. Estimates of daily discharge have been made for the same period.

DRAINAGE AREA.

The drainage area of the Assiniboine river above Brandon is 34,500 square miles.

GAUGE.

A nine-foot vertical staff gauge is nailed to the ice breaker fifty feet upstream from and opposite station 1+60 on the metering section.

CHANNEL.

For three hundred feet upstream and one hundred and fifty feet downstream the channel is straight. It is divided at the section into three parts by the bridge piers. The bottom is of mud and liable to shift, especially at high stages. The banks are high but liable to overflow at high stages.

DISCHARGE MEASUREMENTS.

The meterings are made from the downstream side of the bridge. They cover a range in stage under open water conditions of 12·5 feet.

ACCURACY.

Between gauge heights 97·5 and 104·1 the discharge curve is well defined, between 104·1 and 110·0 it is fairly well defined, above and below these limits it is not well defined for open water conditions. Between gauge heights 96·5 and 98·0 the discharge curve for winter conditions is fairly well defined.

NOTE.—Marked thus ([1]) estimated.

ASSINIBOINE RIVER AT HEADINGLY.

HISTORY.

The metering station was established on April 9, 1913, by S. S. Scovil and has been operated since that date.

LOCATION OF SECTION.

The meter section is located on the downstream side of the C.N.R. bridge, which crosses the Assiniboine river one-quarter mile from the C.N.R. Headingly station.

The I.P. is marked on the flooring at the north end of the bridge on the downstream side and is painted white, "Init. Pt. 0+00."

RECORDS AVAILABLE.

Gauge height records are available from April 17 to November 23, 1913, and for the years 1914 and 1915. Estimates of daily discharge have been prepared from April 17 to November 23, 1913, June 1 to March 1, 1914, and from April 22, 1914, to the end of 1915, except for part of November, 1914.

DRAINAGE AREA.

The area drained by the Assiniboine river above Headingly is 59,420 square miles.

GAUGE.

A nine-foot vertical staff gauge is fastened to the north abutment of the bridge and is read in summer. A winter gauge, three-foot staff, is fastened to the ice breaker for winter readings. Both are referred to the same arbitrary datum.

CHANNEL.

The channel is straight above and below the section for a considerable distance. The stream is divided into four channels by the three central piers of the bridge. The bottom of the stream is of gravel and mud and not liable to shift. The right bank is low and wooded and liable to overflow at higher stages. The left bank is high and not liable to overflow.

DISCHARGE MEASUREMENTS.

The meterings have been made from the downstream side of the bridge in the open water season and in the winter they have been made from the ice at a point about four hundred feet upstream from the bridge.

ACCURACY.

Between gauge heights 75·5 and 80·9 the discharge curve is well defined. Under ice conditions between gauge heights 73·8 and 76·1 the discharge curve is fairly well defined.

NOTE.—All marked thus (1) are estimated.

SHELL RIVER.

The Shell river is one of the largest tributaries of the Assiniboine, emptying into that river in Tp. 23, R. 29, W.P.M. The source of the river is on the northwestern slope of the Duck mountains, which it parallels for a considerable distance, the course being almost due south for the entire length of the river. About five miles from the junction with the Assiniboine it turns sharply to the west and flows in that direction to its mouth.

The watershed drained is narrow, lying between that of the Valley and the Assiniboine, except at the upper part, where it opens out to a width of about thirty-five miles. The total length of the basin being about sixty miles, though the river itself has a length of ninety miles.

In the upper part of the basin the river flows through the Duck Mountain forest reserve, a district in which valuable timber is to be found. The valley of the river is narrow and quite deep, varying between one hundred and three hundred and fifty feet. The valley itself is gravelly and boulder strewn, but the land forming the upper benches and table land is good for agriculture.

At Asessippi, the only town located on the stream, a small flour mill was operated by water power from 1884 to 1911, in which year the dam was washed out.

SHELL RIVER AT ASESSIPPI.

HISTORY.

The first metering of the Shell at Asessippi was taken by W. J. Ireland on September 15, 1913, but the point at which the measurement was made was not considered suitable for a permanent section. This point was at the bridge just below the dam. A second section was established by E. J. Budge on January 16, 1914, one-quarter mile below the bridge, this latter section was afterwards abandoned for one which was located by C. O. Allen on June 9, 1914.

LOCATION OF SECTION.

The section finally located on the Shell river at Asessippi is one and one-quarter miles downstream from the Asessippi bridge, two miles below the mouth of Bear creek, thirteen and one-half miles from Russell and twenty miles south of Roblin. The I.P. is marked by a nail driven in the base of a blazed tree which is on the right bank.

RECORDS AVAILABLE.

Daily gauge heights have been obtained since June 9, 1914, and estimates of daily discharge for the same period have been made.

DRAINAGE AREA.

The area tributary to the Shell above the meter section is 930 square miles. It lies between the watersheds of the Valley river on the east and the Assiniboine on the west.

GAUGE.

A six-foot vertical staff gauge was placed six hundred feet downstream from D. Martel's house and about one mile above the meter section. The gauge is referred to a B.M., which is a nail driven into the foot of a blazed scrub oak tree standing fourteen feet back from the gauge. The datum is arbitrary. On November 18, it was discovered that back water effect was being caused between the gauge and the meter section by beaver dams. A new gauge was therefore established at the meter section, which was referred to a temporary bench mark placed on the side of a blazed 6-inch poplar tree standing one hundred feet above the meter station on the right bank.

CHANNEL.

For sixty feet above the section and one hundred and fifty feet below the channel is straight. The bottom is of small rock and gravel and is permanent. The banks are high and clear and are not liable to overflow. The current is swift.

DISCHARGE MEASUREMENTS.

Measurements are made by means of a cable carrier travelling on a cable stretched across the stream at the section. Sufficient measurements have been taken to define a discharge curve.

ACCURACY.

The curve is well defined over a range in stage of 1·3 feet for open water conditions. Discharge curve for winter conditions is not so well defined.

NOTE.—Marked thus (1) estimated.

BIRDTAIL CREEK.

Birdtail Creek is one of the small tributaries of the Assiniboine river. It joins the latter in Indian Reserve No. 57. The source of the river is on the south slope of the Riding mountains and the course is generally south from the headwaters to the mouth.

The upper part of the drainage area, which is 400 square miles, is very well timbered, and lumbering has been carried on in the district. Towards the mouth the land is given up to agriculture.

There was some question of a small power development on the river, so records of the discharge have been kept. These show that the power output would be very small and subject to interruption during the winter months.

BIRDTAIL CREEK AT BIRTLE.

HISTORY.

This station was established May 14, 1914, by C. O. Allen.

LOCATION OF SECTION.

The meter section is located on the downstream side of the Birtle traffic bridge, on the road between the C.P.R. station and the town of Birtle, one mile from the C.P.R. The I.P. is painted on the handrail of the bridge at the left end on the downstream side.

RECORDS AVAILABLE.

The estimates of daily discharge have been deduced for the open water seasons of 1914 and 1915.

DRAINAGE AREA.

The drainage area is 400 square miles, extending from the Riding mountains southeast to the Assiniboine.

GAUGE.

A vertical staff gauge is secured to the floor of the bridge and is referred to a permanent M.H.S. B.M. This B.M. is set to an arbitrary datum about forty feet northeast of the upstream north end of the bridge.

CHANNEL.

The stream is confined to one channel at all stages; for two hundred and fifty above and one hundred feet below the section the channel is straight. The current is fairly swift and the banks are high and clear and not liable to overflow. The bottom of the stream is of mud and hard clay, not liable to shift.

DISCHARGE MEASUREMENTS.

The measurements are taken from the downstream side of the traffic bridge under open water conditions. For winter conditions measurements are made from the ice.

ACCURACY.

The discharge curve is only fairly well defined over a range in gauge height of three feet, extending from 88·5 to 91·5.

Discharge Measurements of Birdtail Creek at Birtle, 1915.

NOTE.—All marked thus [1] estimated.

LITTLE SASKATCHEWAN RIVER.

The source of the Little Saskatchewan river is on the southern slope of the Riding mountains. It flows in a general southeastern direction until it reaches the town of Minnedosa in Tp. 15, R. 18, W.P.M. at which point it turns and flows almost southwest to its junction with the Assiniboine river in Tp. 10, R. 20, W.P.M. about eight miles west of the city of Brandon.

The drainage area is 1,640 square miles. In the upper part of the basin there are numerous small lakes, and in this section the greater part of the drainage is obtained. The largest tributary, the Rolling river, enters the Little Saskatchewan about thirteen miles above Minnedosa.

In the upper waters the country is covered to a considerable extent by stands of good merchantable timber, a considerable portion of which is within the forest reserve. The rest of the country drained is very well settled, the land offering splendid opportunity for agriculture.

The river valley is well defined, lying between 100 and 300 feet below the general level of the surrounding country. It varies in width between one-quarter of a mile and one and one-quarter miles, the course of the river in the valley bottom being very sinuous, almost doubling its length over the total length of the drainage basin.

A number of small towns are to be found along the course of the river, as Rivers, Gautier, Rapid City, Riverdale and Minnedosa, the latter having a population of about 1,700. There are possible power sites on the river, three of which have been developed, these are at Minnedosa, Rapid City and the Brandon Power Company's plant about two miles from the mouth of the river.

LITTLE SASKATCHEWAN RIVER AT MIDDLETON BRIDGE.

HISTORY.

A metering station was established on the Little Saskatchewan at Middleton Bridge on May 17, 1915, by E. B. Patterson, and from that date this station has been in operation.

LOCATION OF SECTION.

The metering section is located on the downstream side of what is locally known as Middleton bridge, situated in Sec. 6, Tp. 20, R. 20, W.P.M., and approximately eighteen miles north of the town of Elphinstone. The Initial Point is painted on the east end of the handrail of the bridge.

RECORDS AVAILABLE.

Daily gauge readings have been taken from the time of the establishment of the station to the end of the year 1915. Discharge measurements have been made at various stages throughout this period, and from these estimated daily discharges have been computed for a period from May 17 to November 9, 1915. From the latter date to the end of the year ice cover conditions prevailed, and the information obtained is not sufficient to allow the estimating of daily discharges.

DRAINAGE AREA.

The drainage area tributary to the river at this metering station is 184 square miles.

GAUGE.

A six-foot vertical staff gauge has been secured to a pile on the drownstream side of the bridge near the left bank. This gauge is referred to a B.M. on a 10-inch blazed poplar tree, twenty feet west of the bridge on the north side of the road. This B.M. is set to an arbitrary datum.

CHANNEL.

The section of the river on which the station is located is curved both above and below, but the current is sluggish and even across the section. On account of the bridge embankment the entire flow of the stream must cross the section even under high water conditions.

DISCHARGE MEASUREMENTS.

The discharge measurements are taken by wading during low water and from the bridge when medium or high water conditions prevail.

ACCURACY.

Throughout the stage met with during the time observations have been made on the river at this point the discharge curve is not well defined.

NOTE.—Marked thus [1] estimated.

LITTLE SASKATCHEWAN AT ELPHINSTONE.

HISTORY.

A metering station was established on the Little Saskatchewan near Elphinstone on May 10, 1915, by E. B. Patterson, and observations have been carried on at this station since that date.

LOCATION OF SECTION.

The section is located on the downstream side of the traffic bridge known as Indian bridge, one and one-half miles north of the town of Elphinstone. The I.P. is painted on the handrail at the west end of the bridge.

RECORDS AVAILABLE.

From May 10, 1915, to the end of the year daily gauge heights have been recorded, and at various times discharge measurements have been made covering the greater part of the range in stage recorded by the daily gauge height. Estimates of daily discharge have been made for the period from May 10 to November 13. From November 13 to the end of the year ice cover conditions obtained, and sufficient information has not been secured to allow the estimating of daily discharges for this period.

DRAINAGE AREA.

The drainage area tributary to the river at this point is 380 square miles.

GAUGE.

A six-foot enamelled staff gauge has been secured to a pile on the upstream side of the gauge near the left bank. This gauge is referred to a B.M. located fifty-five feet east of the bridge. The B.M. is set to an arbitrary datum.

CHANNEL.

The channel is straight for about one hundred feet below the section, but above it is curved for about three hundred feet; the right bank above and below the section is liable to overflow during high water, but the embankment would prevent overflow at the section. The bed of the stream is composed of boulders and not liable to shift.

DISCHARGE MEASUREMENTS.

The discharge measurements at this station are taken either by wading during low water or from the bridge during high water.

ACCURACY.

Throughout the range in stage recorded by the daily gauge height the discharge curve is well defined.

NOTE.—Marked thus [1] estimated.

CLEAR CREEK.

Clear Creek is one of the tributaries of the Little Saskatchewan in the northerly section of the drainage area. Its source is in Clear lake, from which it derives its name, and from a point at the westerly end of the lake in Tp. 20, R.19, W.P.M., it flows almost due west for a distance of nine miles to its junction with the Little Saskatchewan.

The importance of this creek lies mainly in the fact of its being the outlet of Clear lake. At its head a storage dam has been built to conserve the run-off from the area tributary to the lake, for the use of the power developments on the Little Saskatchewan.

CLEAR CREEK ABOVE JUNCTION WITH LITTLE SASKATCHEWAN.

HISTORY.

A metering station was established on Clear creek by E. B. Patterson on May 31, 1915, and from that time to the end of the year the station has been operated.

LOCATION OF SECTION.

The section is located on the creek one mile upstream from its junction with the Little Saskatchewan. The Initial Point is a three-inch poplar post, three feet from the water's edge on the right bank, and indicated by the painted letters "I.P."

RECORDS AVAILABLE.

From the time of the establishment of the station gauge readings have been made tri-weekly. Sufficient meterings have been made to define a discharge curve covering the range in stage met with, and estimated daily discharges are available to the end of 1915.

DRAINAGE AREA.

The drainage area tributary to the creek at the metering station is ninety-five square miles.

GAUGE.

The gauge at this station is a six-foot enamelled staff gauge secured to a post driven into the bed of the creek and braced. This gauge is referred to a B.M. set to an arbitrary datum, located 50 feet northeast of Initial Point. The bench mark is a four-inch poplar stump painted red, marked "M.H.S. B.M. El. 100.00."

CHANNEL.

The stream throughout its course is very sinuous, but the station is located at a point where the channel is fairly straight. The bed of the stream is gravelly and not liable to change. During high water the left bank is liable to overflow, but this condition would not likely hold for any extended period.

DISCHARGE MEASUREMENTS.

The discharge measurements at this point are made by wading.

ACCURACY.

For the range in stage covered by the discharge measurements the discharge curve is well defined.

NOTE.—Marked thus (1) estimated.

LITTLE SASKATCHEWAN RIVER AT BEILBY'S BRIDGE.

HISTORY.

The station on the Little Saskatchewan was established on March 18, 1914, by W. J. Ireland, under ice cover conditions. It was found when the ice went out that the location was unsatisfactory on account of eddies on the section, and a cable carrier station was established downstream from the bridge. This station has been in continuous operation since that time.

LOCATION OF SECTION.

The meter section is located four hundred feet downstream from Beilby's traffic bridge. It is twelve miles northwest of Minnedosa, five miles west of Clan William and one and one-half mile downstream from the junction of the Little Saskatchewan and Rolling rivers.

RECORDS AVAILABLE.

Records of daily gauge height have been secured from April 25, 1914. Sufficient meterings have been made to define a curve and estimate daily discharges during the open water season from April 25 to November 29, 1914, and from April 12 to November 11, 1915. During the closed water season of 1915 sufficient infomartion was not obtained for computing daily discharges.

DRAINAGE AREA.

The area tributary to the Little Saskatchewan above Beilby's bridge is 1,120 square miles.

GAUGE.

A nine-foot vertical staff gauge is secured to a pile, sixty-four feet from the north end of the bridge on the downstream side. It is referred to a permanent M.H.S. B.M., located seventy-three feet north of the north end of the bridge. This B.M. is set to an arbitrary datum.

CHANNEL.

For five hundred feet above the section and three hundred feet below, the channel is straight. At all stages the river is confined to one channel, the bed of the stream is of sand and gravel and fairly permanent, the banks are low and subject to overflow at extreme stages.

DISCHARGE MEASUREMENTS.

Discharge measurements are made by means of a cable carrier, which travels on a cable which is stretched across the river at the section. The measurements cover a range in stage of 2·5 feet.

ACCURACY.

The discharge measurements taken do not define the discharge curve very well, due to difficulty in obtaining accurate soundings at the section.

LITTLE SASKATCHEWAN RIVER AT MINNEDOSA.

HISTORY.

A station was first established on the Little Saskatchewan at Minnedosa in October, 1912, by W. G. Worden at the highway bridge within the town. This was abandoned and later one was established by C. O. Allen at the power house on July 13, 1914. This station is still in operation.

LOCATION OF SECTION.

The meter section is located on the upstream side of the traffic bridge crossing the Minnedosa Power Company's intake, and about three-quarters of a mile from the C.P.R. station.

RECORDS AVAILABLE.

A gauge height record was kept at the old station on the highway bridge from October 14 to November 2, 1912. A record of daily gauge height has been kept at the head and tailwater of the Minnedosa Power Company from June 2, 1914, to the end of the year 1915.

DRAINAGE AREA.

The drainage area above Minnedosa is 1,200 square miles. The area is not significant in this case, as the station is only used to determine the discharge through the power plant.

GAUGE.

The gauge in the headrace is a six-foot vertical staff enamelled gauge fastened to the intake wall of the power plant on the left hand side. The tailrace gauge is a six-foot vertical staff enamelled gauge fastened to the side of the retaining wall in the tailrace on the right hand side.

CHANNEL.

The channel at the meter section is that formed by the intake for the power plant

DISCHARGE MEASUREMENTS.

Measurements are taken from the bridge across the intake.

ACCURACY.

Owing to the fact that the discharge is controlled entirely by the operation of the power station and quite irrespective of gauge heights, no discharge curve has been constructed.

DISCHARGE MEASUREMENTS OF LITTLE SASKATCHEWAN INTAKE AT MINNEDOSA POWER HOUSE, 1915.

ROLLING RIVER (ERICKSON'S BRIDGE).

HISTORY.

A metering station was established on the Rolling river at Erickson's bridge on May 4, 1915, but it was only operated for a short time, owing to interference with the control points on the stream in this locality through the workings of beavers above and below the section.

LOCATION OF SECTION.

The section is located thirty feet downstream from Erickson's bridge on the E. boundary, Sec. 21, Tp. 18, R. 18, W.P.M. The Initial Point is painted on a fence post on the right bank.

RECORDS AVAILABLE.

From May 3 to June 22, 1915, records of gauge height and estimated daily discharges are available, also miscellaneous discharge measurements taken through the summer of the same year.

DRAINAGE AREA.

The drainage area tributary to the river at this point is 112 square miles

Taken by E. B. Patterson.

Little Saskatchewan Drainage Area—Rolling River Meter Section at Erickson's Bridge.

GAUGE.

A six-foot vertical staff gauge is secured to a pile on the downstream side of the bridge above the section. This gauge is referred to a B.M. set to an arbitrary datum and located twenty yards northwest of bridge. The B.M. is a notch cut in the root of a spruce tree.

CHANNEL.

The channel at the section is straight for a short distance above and below. The bed of the stream is of a gravelly nature. The left bank is liable to overflow in times of high water.

DISCHARGE MEASUREMENTS.

All discharge measurements are taken by wading.

ACCURACY.

On account of the variable control which led to the abandonment of the station, the accuracy is not high.

Discharge Measurements of Rolling River at Erickson's Bridge, Danvers, 1915.

ROLLING RIVER NEAR C.N.R. CROSSING

HISTORY.

A metering station was established on the Rolling river at Lee's bridge on June 22, 1915 and was in operation throughout the open water season of that year.

LOCATION OF SECTION.

The section is located on the downstream side of Lee's bridge, three and one-half miles from Erickson and one-half mile north of C.N.R. The bridge is in Sec. 7, Tp. 18, R. 18, W.P.M. The Initial Point is painted on the downstream hand rail at the east end of the bridge.

RECORDS AVAILABLE.

From the date of the establishment of the station, June 22, 1915, to November 12 daily gauge heights and estimated discharges have been obtained. After the latter date ice cover conditions prevailed and the information obtained was not sufficient to allow the estimating of daily discharges. Discharge measurements covering a range of two feet were obtained.

DRAINAGE AREA.

The drainage area tributary to the river at this point is 235 square miles.

GAUGE.

A six-foot vertical staff gauge is secured to the center pile on the dowstream side of the bridge. This gauge is referred to a B.M. set to an arbitrary datum located on the root of a spruce tree one hundred and fifty feet east of the bridge.

CHANNEL.

The section is located in a slightly curved stretch of the river. The banks are high but at extreme high water the right bank is liable to overflow. The bed of the stream is silt and is liable to shift in high water.

DISCHARGE MEASUREMENTS.

Discharge measurements are made from the bridge at all stages of the river.

ACCURACY.

The discharge curve for the range in stage covered by the discharge measurements is fairly well defined.

DISCHARGE MEASUREMENTS OF ROLLING RIVER NEAR C.N.R. CROSSING, 1915.

WHIRLPOOL RIVER AT DANVERS.

HISTORY.

A metering station was established on the Whirlpool river at Danvers on May 6, 1915, by E. B. Patterson, and throughout the open water season of that year the station was in operation.

LOCATION OF SECTION.

The section is located on the downstream side of what is locally known as Erickson's bridge, one-half mile from Danvers P.O., on the north boundary of Sec. 21, Tp. 18, R. 18, W.P.M. The Initial Point is indicated by a painted I.P. on a pile at east side of section.

RECORDS AVAILABLE.

From the date of the establishment of the station, May 6, 1915, to November 11 of that year, daily gauge heights with estimated daily discharges are available. Discharge measurements covering a range in stage of one and a half feet have been obtained.

DRAINAGE AREA.

The drainage area tributary to the Whirlpool river above the metering section is 79 square miles.

GAUGE.

A six-foot staff gauge is secured to a pile on the downstream side of the bridge. This gauge is referred to a B.M. set to an arbitrary datum on the root of a dry spruce tree on the south side of the road, four hundred feet east of the bridge.

CHANNEL.

The banks in the vicinity of the station are low and in high water will overflow. The bed of the stream is sandy and liable to shift.

DISCHARGE MEASUREMENTS.

The discharge measurements are taken by wading, except during high stages of the river, when they are taken from the bridge.

ACCURACY.

Throughout the range of stage covered by the discharge measurements obtained the discharge curve is well defined.

DISCHARGE MEASUREMENTS OF WHIRLPOOL RIVER AT DANVERS, 1915.

NOTE.—Marked thus ([1]) estimated.

SOURIS RIVER.

The source of the Souris river is in the province of Saskatchewan, northwest of the town of Weyburn. The course of the river from its source is generally southeast crossing the International boundary into the State of North Dakota in Tp. 1, R. 34 West Principal Meridian. After crossing the boundary it bends northeast re-crossing the International boundary to the east of the boundary between Saskatchewan and Manitoba and flowing in a general northeastern direction to its junction with the Assiniboine river near the city of Brandon.

The drainage area of the Souris (22,860 square miles) is very large when compared with the discharge as will be noted by reference to the following tables.

The area drained is largely settled and under cultivation, the soil being of a gravelly nature lightly overlaid by an alluvial deposit. The land is largely open prairie and very little timber is to be found.

The upper part of the river valley is not deep but as the mouth is approached the depth is increased until banks of from 150 to 200 feet are encountered.

The district drained is about the most closely settled in the province and the question of water supply for various purposes renders the gathering of discharge data important.

SOURIS RIVER AT MELITA.

HISTORY.

A metering station was established on the Souris river at Melita on April 23rd and from that date observations have been made at the station.

LOCATION OF SECTION.

The station is located on the downstream side of the traffic bridge in River park in the town of Melita. The Initial Point is painted on the side of the railing at the west end of the bridge.

RECORDS AVAILABLE.

From the date of the establishment of the station to the end of the year 1915 daily gauge records have been obtained. Discharge measurements have been made at various stages of the river covering practically the entire range during the period, and estimates of daily discharge are available for the period from April 23 to November 13. From this latter date to the end of the year ice cover conditions prevailed and the information obtained was not sufficient to allow the estimating of daily discharges.

DRAINAGE AREA.

The drainage area tributary to the river at this metering station is 10,673 square miles.

GAUGE.

A six-foot vertical staff gauge has been secured to the centre pier at the east end of the bridge close to the water's edge on the right bank. The gauge is referred to a permanent M.H.S. B.M. located fifty-seven feet southeast from the southeast corner of the bridge. This B.M. is set to an assumed datum.

CHANNEL.

The channel is straight for a distance of three hundred feet above the section and one hundred and fifty feet below. The banks are high and not liable to overflow. The bed is composed of sandy gravel and under ordinary conditions not liable to shift.

DISCHARGE MEASUREMENTS.

Discharge measurements are made from the bridge during all stages of the river.

ACCURACY.

The discharge curve throughout the range of stage met with since the establishment of the station is fairly well defined.

NOTE.—Marked thus [1] estimated.

SOURIS RIVER AT WAWANESA.

HISTORY.

The station on the Souris at Wawanesa was established on October 7, 1912, by W. G. Worden.

LOCATION OF SECTION.

The meter section is located on the downstream side of the traffic bridge across the Souris river one-quarter of a mile north of Wawanesa. The I.P. is an arrow carved and painted on the guard rail at the intersection of the girder and the guard rail on the downstream side of the bridge at the south end.

RECORDS AVAILABLE.

Daily gauge height records are available for the open water seasons over the period October 7, 1912, to the end of 1915. During the winter season the gauge heights were obtained at intervals of several days. Estimates of daily discharge have been prepared for the open water seasons during the period October 7, 1912, to the end of 1915. There was not sufficient information to estimate daily discharges during the winter season.

DRAINAGE AREA.

The drainage area of the Souris above Wawanesa is 22,500 square miles, part of which lies south of the International boundary.

GAUGE.

A vertical staff gauge is secured to the downstream side of the north pier of the bridge. This gauge is referred to a permanent M.H.S. B.M. located about seventy five feet south west of I.P. The B.M. is set to an arbitrary datum.

CHANNEL.

For two hundred feet above the section and six hundred feet below, the channel is straight, the bed of the river is composed of sand and gravel and not liable to shift. The right bank of the stream is moderately high and not liable to overflow. The left bank is low, marshy and rather thickly wooded with small trees and scrub and is liable to overflow at high stages.

DISCHARGE MEASUREMENTS.

The meterings are taken from the downstream side of the bridge.

ACCURACY.

Between gauge height 100·7 and 102·0 the discharge curve is well defined. Between 102·0 and 104·5 the curve is fairly well defined. Beyond these limits the curve is not well defined.

DISCHARGE MEASUREMENTS OF SOURIS RIVER AT WAWANESA, 1915.

TRIBUTARIES OF LAKE WINNIPEGOSIS.

GENERAL.

Practically all of the drainage west of lake Manitoba and between the Riding mountains and the Saskatchewan river drains directly or indirectly into lake Winnipegosis.

Three small lakes act as intermediate basins and to these the greater part of the drainage first finds its way, being drained from them into lake Winnipegosis. These lakes are:—

Red Deer lake, into which Red Deer river drains, is then drained by the same river into Dawson bay, an arm of lake Winnipegosis.

Swan lake, drained by the Shoal river into Dawson bay which is the collecting basin for the Swan and Woody rivers.

Lake Dauphin, drained by the Mossy river and having as tributaries among others, the Valley and Ochre rivers. The Fork river is a tributary of the Mossy.

RED DEER RIVER.

The source of the Red Deer river is in Tp. 44, R.19 W.2.M, south of Melfort, Saskatchewan. It flows in a general easterly direction into Red Deer lake, an expanse of the river, and also drains the lake into lake Winnipegosis.

The total drainage area of the Red Deer is 5,478 square miles, including Red Deer lake which has an area of 100 square miles. The valley through which the river flows is deep and wide. In the upper portion the tributaries which head in small lakes and swamps are Fir, Etoimami, Pipestone and Barrier rivers, nearly all of which enter from the south.

The upper portion of the drainage area is well timbered, growths of spruce and poplar of merchantable size being found. The Red Deer Lumber Company carry on lumbering operations on the river and operate a saw mill on Red Deer lake, the logs being floated downstream to the mill.

The Canadian Northern Railway crosses the river at Erwood, thirty miles west of the lake, and a spur line has been built in from Powell to touch the west end of the lake at Barrows.

LAKE WINNIPEGOSIS AT WINNIPEGOSIS.

HISTORY.

A gauge was set on lake Winnipegosis on May 22, 1913, by G. Ebner, and during the open water seasons daily gauge records have been obtained at this point.

LOCATION OF GAUGE.

A six-foot vertical staff gauge has been secured to a pile thirty feet north of Standard Lumber Company's wharf in the Mossy river and about 350 feet from the point where the river empties into lake Winnipegosis.

RECORDS AVAILABLE.

Daily gauge readings at this point are available from May 22 to October 27, and at intervals during November and December of 1913, from April 16 to November 15, in 1914, and from May 18 to November 16, 1915.

RED DEER RIVER AT HUDSON'S BAY JUNCTION.

HISTORY.

The station on the Red Deer at Hudson's Bay Junction was established by G. Ebner on August 12, 1913, and replaced a station established by E. Bankson on June 4, 1913, four hundred feet below the ferry.

LOCATION OF SECTION.

The meter section is located at the ferry crossing of the Red Deer river five hundred feet below its confluence with the Elk river and three and one-half miles south of Hudson's Bay Junction on the road to the Red Deer Lumber Company's camp. The I.P. is marked by a nail driven in a pile sixty feet from the water's edge on the right bank at the ferry crossing.

RECORDS AVAILABLE.

Records of daily gauge height have been obtained from July 9 to October 31, 1913, April 30 to November 27, 1914, and from April 14 to December 31, 1915. A few gauge heights are also available taken during the winter seasons. Estimated daily discharges cover the period July 9 to October 31, 1913, April 30 to November 27, 1914, and from April 14 to November 9, 1915.

DRAINAGE AREA.

The area tributary to the Red Deer above the station at Hudson's Bay Junction is 1,900 square miles.

GAUGE.

The gauge is a vertical staff gauge driven into the bed of the river and braced to it is near the right bank and forty feet below the section. This gauge is referred to a permanent M.H.S.B.M. located fifty-two feet upstream from the I.P.

CHANNEL.

The channel is straight for about five hundred feet above and below the section; the river is confined to one channel at all stages; the bed of the stream is covered with boulders and not liable to shift. The banks of the river are low wooded and liable to overflow at high stages.

DISCHARGE MEASUREMENTS.

Meterings are made from a boat by means of a small Price meter.

ACCURACY.

Eleven discharge measurements define the curve fairly well between gauge heights 99·8 and 103·0. Owing to the fact that the Red Deer Lumber Company operate a number of lumber dams on the upper waters of the river the records do not give a true idea of the natural regimen of the river.

NOTE.—Marked thus [1] estimated.

SWAN RIVER.

The Swan river rises on the extreme northwestern slope of the Porcupine mountains. Its course is generally south and east until it reaches a point in Tp. 34, R. 3 W.P.M. when it turns and flows almost due northeast through the valley between Porcupine and Duck mountains into Swan lake.

The valley between the two mountains is broad and deep, but nearly all the drainage entering this section of the river is from the south, most of the tributaries heading in the Duck mountains. To the north the basin is confined by the drainage area of the Woody river which follows a parallel course to the Swan.

The banks of the valley are an alluvial deposit of clay and gravel. The river has an average width of one hundred and fifty feet, the banks ranging from ten to fifty feet in height. The upper parts of the valley are largely covered with a timber growth, but in the lower bottom lands mixed farming is extensively followed. The valley is well settled, the town of Swan River being the principal community.

In 1909 an investigation of the power possibilities of the river was made and a site located in the vicinity of Swan river with a view to supplying that town with power.

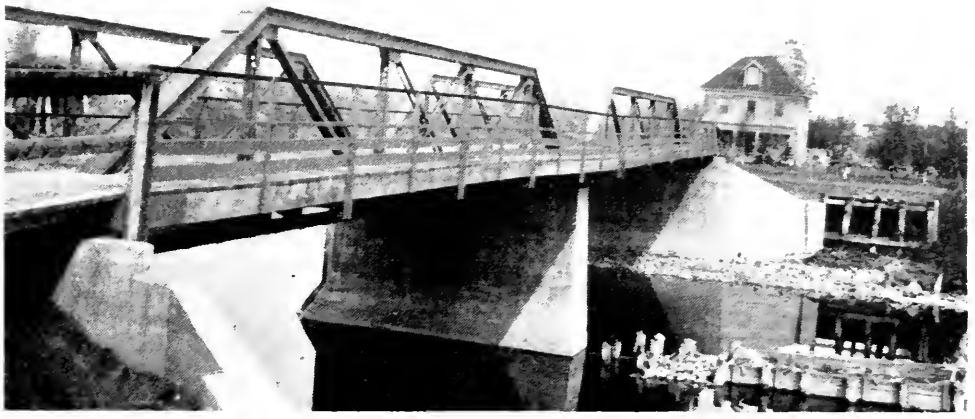
SWAN RIVER AT SWAN RIVER.

HISTORY.

The Swan River station was established by W. G. Worden on October 12, 1912, and has been operated since that date.

LOCATION OF SECTION.

The meter section is located on the downstream side of the new steel traffic bridge which spans the Swan river at the north end of the town of Swan River, Man. The I.P. is marked on the top of the south abutment at the east side.



Taken by F. S. Smith.

SWAN RIVER—SWAN RIVER—SHOWING I.P. AND POSITION OF B.M.

RECORDS AVAILABLE.

Records of daily gauge height are available for part of the period October 12, 1912, to the end of 1915. Blanks in the record occur during winter seasons. Estimated daily discharges are on hand for the periods October 24 to November 16, 1912, April 12 to November 8, 1913, April 15 to November 15, 1914, and from April 14 to November 15 1915.

DRAINAGE AREA.

The area drained above the station of the Swan river is 1,215 square miles.

GAUGE.

The gauge at this station is a chain gauge secured to the lower chord of the upstream side of the bridge; it is referred to a permanent M.H.S. B.M. located forty-five feet northeast of the north abutment of the bridge.

CHANNEL.

Above the section the channel is straight for three hundred feet and also for two hundred feet below. The bridge is a clear span and the river lies in one channel at all stages. The stream bed is of clay and subject to shifting; the current is swift. The right bank is of clay is high and not liable to overflow. The left bank is low and wooded and liable to overflow at high stages.

DISCHARGE MEASUREMENTS.

The meterings are made from the bridge with a small Price current meter.

ACCURACY.

Between gauge heights 99.10 and 101.80 the discharge curve is well defined, between 101.80 and 101.20 it is fairly well defined

WOODY RIVER AT BOWSMAN.

HISTORY.

A metering station was established on the Woody river at Bowsman on May 31, 1915, by F. S. Smith, and since that time has been in operation.

LOCATION OF SECTION.

The section is located on the downstream side of a traffic bridge one mile south of the town of Bowsman. The Initial Point is painted on the lower bar, also on top of the hand rail at the north end of the bridge.

RECORDS AVAILABLE.

From the 31st of May to the 9th of November 1915, daily gauge readings and estimates of daily discharges are available. During this period discharge measurements have been made at the station and these are also available.

DRAINAGE AREA.

The drainage area tributary to the Woody river at this point is 731 square miles.

GAUGE.

A chain gauge has been established at this station referred to a permanent M.H.S. B.M. located forty-five feet east of the north end of the bridge. This B.M. is set to an arbitrary datum.

CHANNEL.

The channel is straight for about two hundred feet above and about six hundred feet below the section. The bed of the stream is of gravel and boulders and not liable to shift. The right bank is low and liable to overflow, but the embankment at the bridge confines the entire flow of the river to the channel at the section.

DISCHARGE MEASUREMENTS.

All discharge measurements are made from the bridge.

ACCURACY.

Throughout the range of stage covered by the discharge measurements obtained, the discharge curve is well defined.

MOSSY RIVER.

The Mossy river is the connecting link between lake Dauphin and lake Winnipegosis, draining the former into the latter. It heads in the extreme northern end of lake Dauphin and flows generally north for a distance of about twenty-one miles.

The Fork and Fishing rivers are tributaries that have their sources on the eastern slope of the Duck mountains. All the basin of the Mossy river, with the exception of that supplied by these rivers, is gathered by the rivers tributary to lake Dauphin. These are the Valley, Turtle, Ochre, Wilson and Vermilion rivers. The upper part of the basin is well timbered, while the lower part is prairie country and used extensively for mixed farming.

The banks of the Mossy vary between five and fifteen feet in height and are of clay overlying a bed of gravel. The river varies in width from 120 to 200 feet and has been considerably improved by dredging.

The country adjacent to the river is very well settled, especially on the west side. The town of Winnipegosis, with a population of 600 people, is situated at the mouth of the river, and the town of Dauphin is the chief centre in the district.

In 1908 the Department of Public Works made a survey of the river, with a view of lowering lake Dauphin. In connection with this project, dredging operations were carried on in the river between 1908 and 1912. A water power project has been looked into on the river near Winnipegosis, and a reconnaissance survey for this purpose was made by a field party of the Manitoba Hydrometric Survey, in the summer of 1913.

MOSSY RIVER AT WILSON'S FARM (BELOW FORK RIVER).

HISTORY.

This station was established on July 28, 1914, by W. J. Ireland, and superseded the one at Lacey's farm owing to the difficulty in securing a gauge reader at that point.

LOCATION OF SECTION.

The meter section is located on Wilson's farm two and one-half miles northeast of Fork river. It is marked by a blazed poplar tree which stands on the left bank just below the metering section. The I.P. is located by a nail driven in the post supporting the cable of the section on the left hand bank.

RECORDS AVAILABLE.

Daily gauge height records have been kept from July 3, 1914, to December 31, 1915. Daily discharges have been computed for a period from July 3 to November 16, 1914, and from March 22 to November 10, 1915. The data secured has not been sufficient to permit the compilation of discharge under ice conditions, which held during the periods from November 16, 1914, to March 22, 1915, and from November 10, 1915, to the end of the year.

DRAINAGE AREA.

The drainage area is 3,950 square miles.

GAUGE.

A six-foot vertical staff gauge is located about nine hundred feet downstream from the section and thirty feet southeast from Mr. Wilson's residence. The gauge is driven into the bed of the stream and braced to the shore. It is referenced to a permanent M.H.S. B.M. located one hundred feet southwest from the gauge.

CHANNEL.

The channel is straight for one hundred and fifty feet above and three hundred feet below the section. The river is confined to a single channel under all stages. The bed of the river is of gravel and permanent. The banks are high and covered with scrub but not liable to overflow.

DISCHARGE MEASUREMENTS.

Meterings are made by means of a cable carrier running on a cable stretched across the river.

ACCURACY.

The discharge curve is fairly well defined over the range in stage covered by the meterings.

NOTE.—Marked thus [1] estimated.

MOSSY RIVER AT LAKE DAUPHIN.

HISTORY.

On May 20, 1913, a gauge was established at the head of the Mossy river by G. Ebner, and from that date gauge readings have been recorded at this station.

LOCATION OF GAUGE.

The gauge is a six-foot vertical staff gauge secured to a support driven into the bed of the river and braced to crib of Clendenning's bridge. This bridge is across the Mossy river about one hundred and fifty feet below the point at which it flows out of Lake Dauphin, and the gauge registers lake level.

RECORDS AVAILABLE.

Gauge records at this point are available for the following periods, from May 21 to December 31, 1913, from January 1 to December 31, 1914, and from January 1 to September 30, 1915.

VALLEY RIVER.

The Valley river is a tributary of lake Dauphin; it rises on the western slope of the Duck mountains, flows south along the foot of the western slope of these mountains, then turns east and flows between the Duck and Riding mountains and continues this generally easterly course to its mouth. There are two tributaries to the valley which are of fair size. These are Short creek, which rises on the slope of Riding mountains, and Drifting river, which joins the Valley three miles west of Valley River station on the C.N.R.

The valley between the Riding and Duck mountains, through which the river flows and from which it takes its name, is about one hundred feet deep and from seven hundred to twenty-five hundred feet wide. The river at ordinary summer stages has a width of between one hundred and two hundred feet. The river bed is composed of gravel and boulders, the banks being of clay which overlies a gravel and boulder bed.

The upper part of the drainage area is practically all within the Duck Mountain Forest Reserve, where considerable stands of spruce, jackpine and poplar are to be found. In the immediate vicinity of the river little clearing has been done, though in the lower part of the valley, and somewhat back from the river, farming is carried on to a considerable extent.

SESSIONAL PAPER No. 25f

VALLEY RIVER AT VALLEY RIVER.

HISTORY.

This station was established on October 25, 1912, by W. G. Worden, and has been in operation since that date.

LOCATION OF SECTION.

The metering section is located on the downstream side of the C.N.R. bridge crossing the Valley river fifteen hundred feet north of the railroad station in that town and one hundred and fifty feet upstream from the traffic bridge. The I.P. is an arrow carved and painted on the downstream side of the bridge at the south end.

RECORDS AVAILABLE.

Records of daily gauge heights have been secured for the greater part of the period October 25, 1912, to the end of 1915. Estimates of daily discharge have been computed for the following periods:—October 25 to November 17, 1912, April 4 to November 16, 1913, April 25 to November 16, 1914, and from April 12 to November 17, 1915. There is not sufficient information to arrive at estimates of daily discharge under winter conditions.

DRAINAGE AREA.

The area tributary to the Valley river above the station is 1,028 square miles.

GAUGE.

A twelve-foot vertical staff gauge is secured to the downstream side of the south bridge abutment, 264 feet from the I.P. on the section. The gauge is referred to a permanent M.H.S. B.M. located 48 feet south of gauge. This B.M. is set to an arbitrary datum.

CHANNEL.

During low stages the water is confined to one channel, but under high water conditions there are two. The channel is straight for 400 feet above and 600 feet below the section. The bed of the stream is of gravel and sand and permanent. The right bank is low, wooded and liable to overflow. The left bank is high and not liable to overflow.

DISCHARGE MEASUREMENTS.

Meterings are taken from the downstream side of the bridge and cover a range in gauge height of 6·6 feet.

ACCURACY.

The discharge curve is well defined between gauge heights 99.5 and 101.7, between gauge heights 101·7 and 105·0 the discharge curve is not well defined.

NOTE.—Marked thus(1) estimated.

OCHRE RIVER.

The Ochre river is a small tributary of lake Dauphin. It rises on the northeastern slope of Riding mountain and flows northeast to the lake, its mouth being in Tp. 20, R. 17, West of the First meridian. The total drainage area of the river is approximately 270 square miles, of which 250 square miles lies above the metering station at Ochre river.

OCHRE RIVER AT OCHRE RIVER.

HISTORY.

This station was established by W. G. Worden on October 18, 1912, and has been in operation since that date.

LOCATION OF SECTION.

The metering section on the Ochre river is located on the downstream side of the traffic bridge, which is one quarter of a mile north of the railway station and one quarter of a mile below the C.N.R. bridge. The I.P. is marked on the guard rail seven feet from the south end on the downstream side.

RECORDS AVAILABLE.

Records of daily gauge height have been obtained for the period October 18, 1912, to the 14th of November, 1915, with omission during the winter months. Estimates of daily discharge have been obtained for the same period.

DRAINAGE AREA.

The drainage area of the Ochre river above Ochre river is 250 square miles.

GAUGE.

A nine-foot vertical staff enamelled gauge is fastened to a timber which is spiked to a pile of the bridge at the south end on the downstream side. This gauge is referred to a permanent M.H.S. B.M. located about nine feet southeast of gauge. This B.M. is set to an arbitrary datum.

CHANNEL.

The channel just above the section is divided by a pile bent which supports the bridge. For fifty feet above and three hundred feet below the station the channel is straight. The bed of the stream is of sand and gravel with a vegetable growth. The banks are low and wooded and liable to overflow at high stages.

DISCHARGE MEASUREMENTS.

The discharge measurements are taken from the downstream side of the bridge under open water conditions. During the winter season they are made from the ice at a point about one hundred feet downstream from the bridge.

ACCURACY.

Between gauge heights 99·5 and 101·3 the curve is well defined, between 101·3 and 107·3 the curve is not well defined. Under ice conditions a fairly well defined curve for the range in gauge height 99·2 to 100·4 has been obtained.

INDEX TRIBUTARIES OF LAKE WINNIPEG FROM THE WEST.

GENERAL.

The rivers coming under this head are the Saskatchewan, Fairford and Dauphin, though they are included in that part known for administration purposes as the District west of lake Winnipegosis.

The Saskatchewan is very important from a navigation, reclamation and power standpoint. The Fairford is also important and to some extent for the above reasons. Its chief importance is that it forms the only outlet of lake Manitoba and through it lake Winnipegosis, lake Dauphin, Swan lake and Red Deer lake are drained.

SASKATCHEWAN RIVER.

The Saskatchewan river is one of the principal tributaries of lake Winnipeg; it flows into that lake near the northern end and drains a large territory to the west of the lake. The total drainage area is 155,000 square miles, extending from the summit of the Rocky mountains eastward to lake Winnipeg. There are two main branches of the river, known as the North and South Saskatchewan. The north branch heads in the Rockies southwest of Edmonton, and flows generally east to its junction with the south branch about fifty miles east of Prince Albert. The tributaries entering the river from the north are small, as the northern limit of the basin follows the river itself closely. The south branch is formed by the junction of the Bow and Old Man rivers, and below the junction of these two the Red Deer enters.

In the province of Manitoba the country adjacent to the river is low lying and swampy, a considerable portion of the level being liable to flooding during high water. Near the mouth the river enlarges into two lake-like expanses known as Cedar lake and Cross lake, from the latter lake the river flows into lake Winnipeg. Cross Lake rapids, Red Rock rapids and Grand rapids occur in this stretch of the river.

In Manitoba the river has an average width of one thousand feet, though above Grand rapids a minimum width of five hundred feet occurs. The river bottom above Cedar lake is composed of clay and gravel, below that point limestone ridges occur between which the bottom is covered with boulders. Valuable timber is to be found along the river at various points, but generally speaking, as the lake is approached, the growth becomes stunted, being for the most part second growth.

Above Grand rapids the river is navigable at certain stages and steamers have been operating as far upstream as Edmonton. At present all navigation below Pas is confined to gasoline launches and like small craft.

Considerable work in the way of reconnaissance and detailed surveys for various purposes has been done by the Dominion Water Power Branch in this part of the river, and in order to further the work, two metering stations have been established by the Manitoba Hydrometric Survey, one at Pas and the other at the head of Grand rapids.

LAKE WINNIPEG AT WINNIPEG BEACH.

HISTORY.

A gauge was set on lake Winnipeg at Winnipeg Beach on May 1, 1913, and records of daily gauge readings have been kept since that date.

LOCATION OF GAUGE.

A nine-foot vertical staff gauge is secured to the inner side of the C.P.R. pier. The gauge is referred to a B.M. of the Canadian Geodetic Survey set in the concrete base at the southeast corner of the C.P.R. water tank at the Winnipeg Beach station.

RECORDS AVAILABLE.

Records of daily gauge readings are available from May 1 to October 31, and at intervals during November and December of 1913, at intervals during January, February and March, and continuous from April 2 to December 31 in 1914, and continuous throughout the year of 1915.

LAKE MANITOBA AT DELTA.

HISTORY.

A gauge was installed on lake Manitoba at Delta on July 9, 1914, by C. O. Allen, and observations as to lake level have been made practically continuously since that time.

LOCATION OF GAUGE.

Delta is a small station on the C.N. Ry. located at the southerly end of lake Manitoba. The gauge installed at this point is a six-foot staff gauge secured to the piling of the breakwater, a short distance south of the bridge across the canal.

RECORDS AVAILABLE.

During the year 1914 daily gauge readings are available from June 12 to the 14th of November, and from the 7th of December to the end of the year. In 1915 the full year records are available.

SASKATCHEWAN RIVER AT PAS.

HISTORY.

The station on the Saskatchewan river at Pas was first established by W. G. Worden on October 21, 1912. On May 27, 1913, a new section at Pas was established by E. Bankson, and this station has been in operation since that date.

LOCATION OF SECTION.

The first section was located about one-quarter of a mile below the site of the Hudson's Bay Railway bridge at Pas. On May 27, 1913, this section was moved upstream to the downstream side of the H.B. Railway bridge. The I.P. is located on the handrail near the south end of the bridge on the downstream side, and is vertically above the river face of the south abutment. It is painted white and marked "0+00 I.P."

RECORDS AVAILABLE.

Records of daily gauge height were kept at various intervals from th early part of 1912 to the end of 1915. From October 21, 1912, to the end of 1915 the gauge heights are rather more continuous. Estimates of daily discharge have been computed for the periods covered by daily gauge heights from April 13, 1913, to the end of 1915.

DRAINAGE AREA.

The drainage area tributary to the Saskatchewan above Pas comprises the greater portion of Western Canada lying between parallels 49 and 54 north latitude and between the Rocky mountains and lake Winnipeg. The total area is 149,500 square miles.

GAUGE.

A twenty-foot vertical staff gauge has been fastened to the downstream side of the first pier from the south bank and 10 feet above the metering section. The gauge is referred to D.P.W. B.M. No. 79, which is a cross on a copper plug set on the west side of the south abutment of the H.B. Railway bridge, and is about three feet from the ground level. It is marked P.W.D. B.M. No. 79.

CHANNEL.

The river is divided by the bridge piers into six channels at low water and eight channels at high water. For 1,300 feet above and 2,700 feet below the section the channel is straight. The bed of the river is covered with gravel and small boulders, but at the section the stream bottom is somewhat shifting. The right bank is high and not liable to overflow, the left bank is low and liable to overflow at high stages. At extreme high water there is a small discharge through an overflow channel about 500 yards south of the bridge.

DISCHARGE MEASUREMENTS.

The discharge measurements were taken from a boat on the first section established. Since May, 1913, the meterings have been taken from the downstream side of the H.B. Ry. bridge.

ACCURACY.

The discharge curve for the station is well defined between gauge heights 818·5 and 822·7, between 822·7 and 828·0 the discharge curve exhibits all the characteristics which are peculiar to certain large rivers, in that the discharge for the same gauge height varies according as the river is on a rising or a falling stage. Above gauge height 627·0 and below 818·5 the discharge curve is fairly well defined.

DISCHARGE MEASUREMENTS OF SASKATCHEWAN RIVER AT PAS, 1915.

NOTE.—Marked thus (1) estimated.

SASKATCHEWAN RIVER AT THE HEAD OF GRAND RAPIDS.

HISTORY.

This station was established by E.B. Patterson on July 31, 1912, and has been in continuous operation since that date.

LOCATION OF SECTION.

The meter section on the South Saskatchewan river at the head of Grand Rapids is located 640 feet below the Hudson's Bay Company's wharf, situated at the upper end of their tramway and 3,200 feet above the head of Grand Rapids. The I.P. is a hub at the top of the left bank. It is referenced to the end of a traverse line running from the Hudson's Bay Company tramway.

RECORDS AVAILABLE.

Intermittent records of daily gauge height extend over the period, August 3, 1912, to November 6, 1913, during the open water season. From November 7, 1913, to September 5, 1914, and from March 2 to December 31, 1915, a record of continuous gauge heights has been taken. Estimates of daily discharge have been prepared for the following periods: — August 1 to November 30, 1912, May 19 to November 11, 1913, April 23 to September 5, 1914, and from March 2 to December 31, 1915. Difficulty has been experienced in securing gauge height records during the winter months.

DRAINAGE AREA.

The drainage area of the Saskatchewan river above the head of Grand Rapids is 155,100 square miles.

GAUGE.

A nine-foot vertical staff gauge has been placed at the end of the section and fastened to a crib which acts as a retaining wall for the bank. Prior to this gauge being placed, one was secured to the dock of the Hudson's Bay Co., about 500 feet above the section, and it is to this gauge that the records given are referred.

CHANNEL.

For 800 feet above and 500 feet below the section the channel is straight. The hydraulic gradient for this section is quite perceptible. The river is confined to one channel at all stages, the bed of the stream is of sand and gravel and fairly permanent. The banks are high, covered with scrub and are not liable to overflow.

DISCHARGE MEASUREMENTS.

Discharge measurements in open water seasons are made from a boat located on the section by range poles, the distances between stations being determined by stadia or triangulation.

ACCURACY.

The discharge curve is only fairly well defined between the extreme limits of gauge heights which are 786·0 and 789·4. Owing to the hydraulic gradient the section may be considered an open water one, as very little ice forms at this point during the winter season.

DISCHARGE MEASUREMENTS OF SASKATCHEWAN RIVER AT GRAND RAPIDS, 1915.

NOTE.—Marked thus([1]) estimated.

FAIRFORD RIVER.

The Fairford river forms the outlet of lake Manitoba. It empties into lake St. Martin, which in turn is drained by the Dauphin river. The Fairford river is quite short, a lake-like expanse known as lake Pinemuta occurring between lake Manitoba and lake St. Martin.

Lake Manitoba, which has an area of 1,711 square miles, forms the basin into which practically all the territory, lying between the Assiniboine and the Saskatchewan rivers and to the east of the Riding, Duck and Porcupine mountains, drains. The soil is generally clay and suitable to agriculture. A considerable proportion of the area is timbered and in certain sections rock outcrops occur. Numerous lakes are also to be found; among these are lake Winnipegosis, lake Dauphin, Red Deer lake, Swan lake and many others varying in size from mere ponds to lakes of the size mentioned.

The banks of the Fairford river vary from three to ten feet in height. At the upper or lake Manitoba end they are well defined, gradually flattening out below Fairford until they open out into wide, low lying marshy ground in the vicinity of lake Pinemuta. Below this lake they are somewhat higher but again change until they merge with the low swampy shores of lake St. Martin.

The Fairford river varies in width from 500 to 900 feet and at two points, one about one half mile below the outlet of lake Manitoba, flows over a low limestone ridge or bar.

Some surveys of the river have been made by the Department of Public Works, with a view to improving it for navigation purposes. In addition to this a water power reconnaissance survey was made in 1913 by the Manitoba Hydrometric Survey.

FAIRFORD RIVER AT FAIRFORD.

HISTORY.

This station was established by G. H. Burnham on June 27, 1912, and has been in continuous operation since that date.

LOCATION OF SECTION.

The metering section is located on the downstream side of the C.N.R. bridge, which crosses the Fairford river at Fairford and is 2½ miles below lake Manitoba. The I.P. is located on the north abutment of the bridge on the downstream side.

RECORDS AVAILABLE.

Records of daily gauge height have been obtained from June 27, 1912, till the end of December, 1915. A number of meterings have been taken during the same period. Owing to the change in slope due to rising and falling of lake Manitoba caused by the wind, it has not been possible to define a discharge curve for the station.

DRAINAGE AREA.

The area tributary to the Fairford river above this station includes the total drainage area of lake Manitoba and lake Winnipegosis, and is 31,900 square miles.

GAUGE.

A six-foot vertical staff enamelled gauge is fastened to the first bridge pier from the left bank and is referred to C.N.R. datum.

CHANNEL.

The channel is straight for 400 feet above and 500 feet below the section. It was originally divided by the fifteen bridge piers into sixteen sections at all stages. In 1914 the bridge was replaced by a steel structure resting upon piers which divided the channel into four sections, the old pile bents being removed. The bed of the stream is gravel and not subject to shifting. The banks are high though subject to overflow at high stages.

DISCHARGE MEASUREMENTS.

The meterings are made from the downstream side of the C.N.R. bridge, the station being an open water station the year around.

ACCURACY.

Owing to the wind effect on lake Manitoba and the consequent range in stage and its effect upon the slope of the river, it has not been possible to define a discharge curve for this section.

Discharge Measurements of Fairford River at Fairford, 1915.

TRIBUTARIES OF LAKE WINNIPEG FROM THE EAST.

GENERAL.

The rivers of importance entering lake Winnipeg from the east are:—
Brokenhead,
Winnipeg,
Manigotagan,
Bloodvein,
Pigeon,
Berens.

These tributaries drain the territory to the west of the watershed of the Great Lakes and Hudson's Bay. Practically all of this country is unsurveyed, so that it is not possible to delimit accurately their actual drainage basins. Practically all the drainage area lies in the Laurentian formation, small lakes and ponds abound and a considerable portion of the surface is covered by muskeg. The rivers are generally in the nature of a series of pools or small lake-like expanses, connected by short narrow channels which are interrupted by falls and rapids. Small stands of merchantable timber are to be found throughout the district, being composed of spruce, jack pine, poplar and birch.

Of the above rivers the Winnipeg is dealt with separately, and of the remainder, continuous records of discharge are available for the Brokenhead and Manigotagan; for the Berens and Pigeon rivers, individual meterings have been obtained.

BROKENHEAD RIVER.

The drainage basin of the Brokenhead river lies in the narrow strip of country between the basin of the Winnipeg and Whitemouth rivers on the east and of the Red river on the west. The river flows northwesterly and empties into lake Winnipeg.

The drainage area is 910 square miles, the basin being 22 miles in width at the widest point and apprxoimately 75 miles long. The greater portion is low lying and empty, though at the lower end part has been placed under cultivation by the aid of drainage work. The whole area can be reclaimed.

The banks are low and the stream bed is of clay, with boulders occurring in some sections

BROKENHEAD RIVER AT SINNOT.

HISTORY.

The station on the Brokenhead at Sinnot was established by G. H. Burnham on May 30, 1912.

LOCATION OF SECTION.

The section is located on the downstream side of the traffic bridge and is nine hundred feet northeast of the C.P.R. station at Sinnot. The I.P. is marked by a group of nails driven into the floor of the bridge on the downstream side and vertically above the face of the south abutment.

RECORDS AVAILABLE.

Records of daily gauge height have been secured for the periods June 8 to November 30, 1912, April 29 to November 30, 1913, and April 13 to December 31, 1914, and from January 1 to December 31, 1915. A number of meterings have also been secured and estimates of daily discharge have been prepared for the above periods, with the exception of the winter periods of 1915, when sufficient information is not available to allow the estimating of daily discharges.

DRAINAGE AREA.

The drainage area tributary to the Brokenhead above Sinnot is 530 square miles.

Taken by M. S. Madden.

BROKENHEAD RIVER—SINNOT—STATION AND I.P. FROM BELOW, RIGHT BANK.

GAUGE.

A vertical staff gauge is secured to a pile of the bridge opposite station 12.5 on the meter section. This gauge is referred to a permanent M.H.S. B.M. located twenty-three feet southwest of I.P. on the section. This B.M. is set to an arbitrary datum.

CHANNEL.

For three hundred feet above and three hundred feet below the meter section the channel is straight. The river is confined to the channel at all stages but is divided into four sections by the three pile bents supporting the bridge. The bed of the stream is of gravel and boulders, and permanent. The banks are fairly high and comparatively free from overflow.

DISCHARGE MEASUREMENTS.

The discharge measurements are made from the downstream side of the traffic bridge

ACCURACY.

For the open water season the discharge curve is well defined between gauge heights 91·2 and 92·5, between gauge heights 92·5 and 91·2 the curve is fairly well defined. For winter conditions a fairly well defined curve has been obtained for the range in gauge height 89·8 to 91·0

NOTE.—Marked thus ([1]) estimated.

MANIGOTAGAN RIVER.

The Manigotagan river, also known as the Bad Throat river, empties into lake Winnipeg from the east about fifty miles north of Fort Alexander. The drainage area is approximately three hundred square miles, though it cannot be definitely determined, as the river lies almost entirely in unsurveyed territory. The general course of the river from source to mouth is northwest. There are a number of lake-like expanses in the river between Long lake and Turtle lake, these are known as Caribou, Musk Rat, Moose and Bull Frog lakes.

At the mouth of the river the land is adapted to agriculture, being good clay land. Above Wood falls the country changes and rock outcrops occur; these form barriers across the river, causing falls or rapids; between these the banks are high and rocky, or low, with valleys leading back into muskegs.

The river above Wood falls, for a distance of twenty-five miles has an average width of 175 feet. Above this point it is a series of small lake-like expanses or pools of several hundred feet in width joined by narrow stretches, which in the majority of cases are broken by falls or rapids.

The entire drainage area is more or less covered with timber growth; this is not of merchantable size and is of inferior quality, consisting of spruce, scrub oak, birch and poplar. In the upper part a fringe of good spruce timber is to be found bordering the lakes.

In 1913 a reconnaissance survey of the power possibilities of the river was made by a party sent out by the Manitoba Hydrometric Survey.

MANIGOTAGAN RIVER AT WOOD FALLS.

HISTORY.

The station on the Manigotagan was estabished on December 21, 1912, by G. J. Lamb, and has been operated since that date.

LOCATION OF SECTION.

The meter section is located two hundred feet above the first falls, known as Wood falls. It is about one mile northeast of the Manigotagan post office and three miles from the large island at the mouth of the river. The I.P. is marked by a spike driven into a 12-inch tree which is blazed and stands near the water's edge on the left bank.

RECORDS AVAILABLE.

A record of daily gauge height has been secured for the periods April 19 to October 31, 1913, April 18 to November 15, 1914, and from December 12, 1914, to December 31, 1915. Estimates of daily discharge have been computed for the same period, with the exception of periods of ice cover conditions, during which periods the information at hand is not sufficient to allow the computation of daily discharges.

DRAINAGE AREA.

The drainage area tributary to the Manigotagan above the section is 375 square miles.

GAUGE.

Two gauges are in operation at this point. The first is a three-foot vertical staff enamelled gauge fastened to a two by four inch scantling which is driven into the river bed 135 feet below the meter section and in a small bay near the right bank above the falls. The second is a three foot vertical staff enamelled gauge fastened to a two by four inch scantling which is secured to the perpendicular rock face on the right shore one hundred feet below and facing Wood falls. Both gauges are referred to a B.M. which is located on a horizontal ledge of rock ten feet from the gauge below the falls, and is marked by means of paint on the rock face, "W.P.S. B.M."

CHANNEL.

The river occupies one channel at all stages, it is straight for three hundred feet above and one hundred feet below the section. The banks are high and wooded and not liable to overflow.

DISCHARGE MEASUREMENTS.

Discharge measurements have been taken at this point by means of a canoe kept on the section line with the aid of a tagged line stretched across the river.

ACCURACY.

On account of the small number of discharge measurements taken at this point the discharge curve is not well defined.

NOTE.—Marked thus [1] estimated.

BERENS RIVER.

The Berens river enters lake Winnipeg from the east, about one hundred and forty miles north of Fort Alexander. It is the most important tributary of the lake entering from the east, with the exception of the Winnipeg river. It has a drainage area estimated to be 7,800 square miles and a length of approximately 300 miles. The headwaters lie near the height of land which forms the south and west limits of the Severn and Albany drainage basins. Many lakes are to be found in the district, though their areas are not well defined, as they are in unsurveyed territory.

The country drained is typical of the Laurentian formation, abounding in muskegs and swamps with frequent rock outcrops. These rock outcrops form barriers across the river, and are the reason for the numerous falls and rapids. Some fifty-two falls and rapids occur between the first fall which is five miles from the mouth, and Family lake, and these vary in height between three and forty feet.

Family Lake also forms the source of the Pigeon river, which parallels the course of the Berens and empties into lake Winnipeg a few miles south of the mouth of the former river.

The Berens river was examined by a party sent out by the Manitoba Hydrometric Survey to determine its power possibilities. This survey revealed the fact that there are a number of feasible sites on the river.

The country is not heavily timbered but is covered with a growth of small spruce, poplar, birch and scrub oak. There is little merchantable timber to be found along the river.

Taken by D. B. Gow.

NELSON RIVER.

GENERAL.

The Nelson river forms the outlet of lake Winnipeg, flowing through the central portion of northern Manitoba and emptying into Hudson's Bay at Port Nelson. The Nelson river discharges all the water collected by lake Winnipeg from an immense drainage area, and it forms one of the principal systems of the North American Continent, the basin comprising an area of 450,000 square miles.

The territory drained varies from the open prairie forming the great central plain to the rugged and magnificent country found in the Rockies, between these extremes of physical characteristics all gradations may be found in the basin. The vegetation to be found covers as wide a range.

The western part of the drainage area is practically devoid of lakes, but in the south and eastern portions are to be found some of the largest fresh water bodies on the continent. These lakes are so situated in relation to the Nelson river that the maximum natural storage effect is exerted upon the flow of that river; in consequence the maximum discharge may be expected to approximate closely to the mean discharge.

The river has a length of 430 miles, and in this distance the drop aggregates 712 feet. The potential power possibilities of the river are therefore apparent. In the upper reaches the river has the appearance of a chain of lakes connected by short stretches of river which are interrupted by falls and rapids. These characteristics which hold for the upper 250 miles of river gradually change as the mouth is approached, the drop in the river not being as distinct but more in the nature of swifts and flat rapids, though the banks become high as the Bay is approached.

The first expanse below the lake Winnipeg outlet is known as Playgreen lake, below which there are two channels known as East and West rivers. Sea falls is to be found on East river and the latter then expands into Pipestone lake. The junction of these two branches occurs in Cross lake. Below that point are Sepewesk, Split lake and Gull lake. The rapids and falls in order are Ebb and Flow rapids, Whitemud falls, Bladder rapids, Over the Hill, Red Rock and Chain of Rocks rapids; Manitou or Devil's rapids, Grand Rapids, Chain of Islands rapids, all being above Split lake. Below Split lake are Gull, Kettle, Long Spruce and Limestone rapids.

The country adjacent to the Nelson river is practically unsettled, though on account of the building of the Hudson's Bay railway there has been considerable activity along the river. The timber growth is scattered, including spruce, birch and poplar, and the clay soil to be found is very fertile.

A reconnaissance survey of the river was made by the late William Ogilvie in 1910 for the Dominion Water Power Branch, also discharge measurements were obtained. After gathering miscellaneous records in 1912-13, a metering station was established in 1914 by the Manitoba Hydrometric Survey above Manitou Rapids, and this has been operated since that date.

NELSON RIVER AT WARREN'S LANDING.

HISTORY.

A gauge was set at this point on September 28, 1913, by A. Pirie, and since that time records have been obtained at this station.

LOCATION OF GAUGE.

Warren's Landing is located at the head of the Nelson, where it flows from lake Winnipeg, and the gauge located here registers lake Winnipeg water level. The gauge is a six-foot vertical staff gauge and is secured to the side of dock of the Northern Fish Co.

RECORDS AVAILABLE.

Gauge records at this point are available from September 28 to December 31 of 1913; from January 1 to February 28, and from March 3 to December 31, of 1914 and from January 1 to October 13, 1915.

NELSON RIVER AT NORWAY HOUSE.

HISTORY.

A gauge was established on the Nelson river at Norway House on September 13, 1913, by A. Pirie, and gauge readings have been obtained at intervals since that time.

LOCATION OF GAUGE.

Norway House is located on the south channel of the Nelson river at the upper end of Little Playgreen lake and twenty miles below Warren's Landing. The gauge is a six-foot vertical staff gauge bolted to the rock in front of the Hudson's Bay Co. warehouse.

RECORDS AVAILABLE.

Since the installation of the gauge records have been obtained intermittently to the end of 1915.

NELSON RIVER ABOVE SHELL RAPIDS.

HISTORY.

This station was established by G. J. Lamb on July 18, 1914.

LOCATION OF SECTION.

The meter section is located at a point three and one-half miles upstream from Manitou landing and four miles above the Shell rapids. The I.P. is marked on a sloping face of rock northeast of the gauge and is a wooden plug driven in a 1½-inch hole drilled in the rock.

RECORDS AVAILABLE.

Records of daily gauge height were secured from July 2 to October 14, 1914, and from February 7 to April 10 and June 27 to October 9, 1915. A number of discharge measurements were taken over the same period.

DRAINAGE AREA.

The drainage area tributary to the Nelson river is 450,000 square miles, of which 24,000 square miles lies below Shell rapids. The river drains lake Winnipeg into Hudson's Bay. Practically all Canadian territory lying south of latitude 53 and between the summit of the Rockies and lake Superior is tributary to this river.

GAUGE.

The gauge is a vertical staff enamelled gauge fastened to a six-inch spruce post driven in the bed of the river and braced; it is further strengthened by being weighted with large boulders. The gauge is referred to a B.M. which is marked by a triangle painted in red on the face of the rock near the I.P. and marked "M.H.S. B.M." The datum of the B.M. is an assumed elevation.

Taken by G. J. Lamb.

NELSON RIVER. METER SECTION FOUR MILES ABOVE SHELL RAPIDS.

CHANNEL.

For fifteen hundred feet above the section and eight thousand feet below, the channel is straight. The river is confined to the channel at all stages, and has a depth on the section varying between twenty and sixty-nine feet. The bed of the stream is of gravel and boulders and not liable to shift. The current is swift and the banks are high and wooded and not liable to overflow.

DISCHARGE MEASUREMENTS.

The meterings are made from a canoe held on the section by means of a stay line stretched across the river and supported on floats.

ACCURACY.

No daily discharge estimates have been arrived at from the gauge heights and discharge measurements, as it has been found impossible to define a regular rating curve on account of the varying slope in the river due to the prevalence of high winds.

DISCHARGE MEASUREMENTS OF NELSON RIVER AT 4 MILES ABOVE SHELL RAPIDS, 1915.

Note:—Ice cover conditions.

MISCELLANEOUS RECORDS.

In a number of cases where stations have been established after one or several meterings have been taken, it has been found that the location was not a desirable one, either on account of the difficulty in obtaining an observer for the daily gauge heights or on account of the physical features obtaining at the station preventing accurate records being obtained.

In other cases sufficient information has not been obtained to properly define a discharge curve, though the records obtained would indicate that a curve may be defined by fuller information. In this case the gauge heights are on file, and when the necessary additional data is secured estimates of daily discharge will be made.

Where the above conditions have been encountered, and as the discharges obtained may be of some immediate value, the records are published under the headings, "Miscellaneous Records."

LAKE OF THE WOODS DATA

PART III.

LAKE OF THE WOODS DATA

LAKE OF THE WOODS MILLING CO. MILL "A" HEADRACE AND TAILRACE GAUGES.

HISTORY.

The recording of the water levels in the forebay and tailrace of Mill "A" was commenced by the Lake of the Woods Milling Company in May of 1896 and was discontinued in January of 1912.

LOCATION.

There were no gauges set at these locations, the readings were taken by measuring down from the floor of the power house, the elevation of which was 1063.00 W.P.S. Datum. The readings were recorded in feet and inches below this elevation.

RECORDS AVAILABLE.

From the time of the commencement of the record on May 3, 1896, readings were taken at irregular intervals each year until January 12, 1912, at which time the reading of these water levels was discontinued.

WINNIPEG RIVER—BELOW FORT ISLAND.

HISTORY.

In 1914, on October 8, a staff gauge was established on the Winnipeg river directly below Old Fort island, by S. C. O'Grady.

RECORDS AVAILABLE.

From the time of installation of this gauge records of gauge readings are available up to December 4 of the same year, when the station was abandoned.

MEAN DAILY GAUGE HEIGHT, IN FEET, OF WINNIPEG RIVER BELOW OLD FORT ISLAND, FOR 1914.

Relation between gauge reading and datum:—
Zero of gauge = 936·61 W.P.S. datum, Oct. 8.
Zero of gauge = 936·61 W.P.S. datum, Nov. 3.
Zero of gauge = 936·53 W.P.S. datum, Nov. 25.

[1] Frozen at gauge.

[2] Ice 6 inches thick at gauge, and frozen 400 feet out from gauge, channel still open. On Feb. 15, 1915, channel was still open.

SESSIONAL PAPER No. 25f

LAKE OF THE WOODS, ONTARIO D.P.W. GAUGE AT KEEWATIN.

HISTORY.

This gauge was originally set by the Ontario Department of Public Works. In 1911 it was tied in to W.P.S. datum in connection with Winnipeg River Power Surveys, and from May 1, 1913, gauge readings have been obtained by members of this Survey.

LOCATION.

This staff gauge is secured to a pile on the west side and near the south end of the Keewatin Lake bridge.

RECORDS AVAILABLE.

From May 1, 1913, continuous daily record of gauge readings at this point are available.

MEAN DAILY GAUGE HEIGHT, IN FEET, OF ONT. D.P.W. LAKE GAUGE, KEEWATIN, FOR 1913.

SESSIONAL PAPER No. 25f

WINNIPEG RIVER ONTARIO D.P.W. GAUGE AT MILL "A" KEEWATIN.

HISTORY.

This gauge was originally set in place by the Ontario Department of Public Works but was tied in to W.P.S. datum on June 25, 1912, and from June 1, 1913, gauge readings have been taken at this point by members of this Survey.

LOCATION.

This gauge is located on the arm of the Winnipeg river known as Darlington bay and is about 50 feet north of the power house head gates of Mill "A" of the Lake of the Woods Milling Co. at Keewatin.

RECORDS AVAILABLE.

From the 1st of June, 1913, continuous records of gauge readings at this point are available.

MEAN DAILY GAUGE HEIGHT, IN FEET, OF ONT. D.P.W. RIVER GAUGE MILL "A", KEEWATIN, FOR 1913.

Relation between gauge reading and datum:—
Zero of gauge = 959·02 W.P.S., Jan. 1—Dec. 31, 1914.
Zero of gauge = 959·03 W.P.S., Jan. 1—Dec. 31, 1915.
Gauge moved on 13th April, carried away on 9th May, replaced on 10th May, 1915

SESSIONAL PAPER No. 25f

WEST BRANCH WINNIPEG RIVER, TAILRACE NORMAN DAM.

HISTORY.

The staff gauge in the tailrace of the Norman dam was originally set in place by the Ontario Department of Public Works, but the taking of records on same was discontinued in 1907 or 1908. In October of 1913 the gauge was tied in to W.P.S. datum, and records have been taken since that time by this Survey.

LOCATION.

This staff gauge is secured to the north side of a timber crib at the lower end of the fish-way at the southerly end of the rock fill section of the Norman dam.

RECORDS AVAILABLE.

Records of daily readings on this gauge are available for the year 1913 from October 8 to the end of the year, with the exception of one day in October and six days in November. For the year 1914 the record is complete with the exception of ten days in September, and for 1915 with the exception of four days in December.

Relation between gauge reading and datum.—
Zero of gauge = 1,000·00 W.P.S. datum

WESTERN OUTLET, LAKE OF THE WOODS (FOREBAY, NORMAN DAM).

HISTORY.

The staff gauge in the forebay of the Norman dam was originally set by the Ontario Department of Public Works. In June of 1913 the gauge was tied in to W.P.S. datum, and observations have been made on this gauge since that time by this Survey.

LOCATION.

This gauge is secured to the upstream side of the crib at the head of the fishway located at the southerly end of the rock fill section of the Norman dam.

RECORDS AVAILABLE.

During the year 1912, dating from June 6 and in 1913 to September 20, the readings available for this gauge are scattered, but from this latter date to the end of 1915 practically continuous daily readings are available.

Relation between gauge reading and datum:
Zero of gauge = 1,000·00 W.P.S., datum

KEEWATIN RIVER BRIDGE.

HISTORY.

The gauge at Keewatin river bridge was established on June 28, 1912, by S. S. Scovil, at the time of the establishment of a metering section on the Winnipeg river at north side of Tunnel island.

LOCATION.

This gauge is located on an upstream pile at the south end of the Keewatin river bridge, which is located one mile west of the metering section above referred to.

RECORDS AVAILABLE.

From the time of the installation of the gauge, daily readings have been taken, with the exception of December, 1912, and January, February and part of March, 1913, when readings were taken once a week.

SESSIONAL PAPER No. 25f

MEAN DAILY GAUGE HEIGHT, IN FEET, OF WEST BRANCH WINNIPEG RIVER AT KEEWATIN RIVER BRIDGE, FOR 1912 AND 1913.

Relation between gauge reading and datum:—
Zero of gauge = 1,000·00 W P S. datum, Jan. 1 — Dec. 31, 1914, 1915

KENORA POWER HOUSE, EAST BRANCH WINNIPEG RIVER HEAD AND TAILRACE GAUGES.

HISTORY.

The present tailrace gauge of the Kenora Power House was set in place by the employees of the Power House in the Fall of 1910.

The headrace gauge was set in place in August of 1907, though the location has been slightly changed since that time.

On June 24, 1912, both of these gauges were tied in to W.P.S. datum and records of daily gauge height have been taken since May 1, 1913, by members of this Survey.

LOCATION.

The tailrace gauge at the Kenora Power House is located about fifty feet downstream from the easterly end of the generator room.

The headrace gauge is placed at the easterly end of the forebay about thirty feet above the rocks at the head gates of the plant.

RECORDS AVAILABLE.

From May 1, 1913, continuous daily dauge readings on these two gauges are available

MEAN DAILY GAUGE HEIGHT, IN FEET, AND MEAN DAILY DISCHARGE, IN FEET PER SEC., OF EAST BRANCH WINNIPEG RIVER AT KENORA POWER HOUSE, FOR MAY, JUNE, JULY AND AUGUST, 1913.

Relation between gauge reading and datum:—
Zero of headrace and tailrace gauges = 1,000·00 W P S datum.

METEOROLOGICAL STATION, KEEWATIN.

In the Spring of 1913 a meteorological station was established at Keewatin on the Lake of the Woods, and from the month of May of that year continuous records have been obtained at this station.

The equipment of the station consists of:—

(1) A galvanized iron evaporation tank supported on a raft on the surface of the lake, and provided with brass pointer and measuring cups.

(2) One Howard rain gauge.

(3) One thermometer for water temperatures.

(4) One recording thermometer.

(5) One recording barometer.

(6) Wing gauge of the Robertson type.

(7) One hygrometer.

SLOPE GAUGES ON WESTERN OUTLET, LAKE OF THE WOODS.

HISTORY.

In August of 1913, fourteen gauges were set on the western outlet of the Lake of the Woods. These gauges were set for the purpose of obtaining slope data in connection with discharge measurements taken on the western outlet at the Norman traffic bridge.

The upper of these gauges is set to head-lake level, while the lower is set in the tailwater of the Norman dam.

From the time of installation of these gauges, readings have been obtained during the time in which meterings have been taken at the Norman traffic bridge metering station.

TABLE OF DISCHARGES AND SLOPE GAUGE READINGS AT WESTERN OUTLET, LAKE OF THE WOODS.
